[13535] Another function of GAM88 is therefore inhibition of LOC283911 (Accession XP_211259.2) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283911.

[13536] LOC284277 (Accession XP_209102.1) is another GAM88 target gene, herein designated TARGET GENE. LOC284277 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284277, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284277 BINDING SITE, designated SEQ ID:17038, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13537] Another function of GAM88 is therefore inhibition of LOC284277 (Accession XP_209102.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC284277.

[13538] LOC284906 (Accession XP_209402.1) is another GAM88 target gene, herein designated TARGET GENE. LOC284906 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284906, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284906 BINDING SITE, designated SEQ ID:16684, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13539] Another function of GAM88 is therefore inhibition of LOC284906 (Accession XP_209402.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284906.

[13540] LOC285321 (Accession XP_208313.1) is another GAM88 target gene, herein designated TARGET GENE. LOC285321 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285321, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC285321 BINDING SITE, designated SEQ ID:5638, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13541] Another function of GAM88 is therefore inhibition of LOC285321 (Accession XP_208313.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285321.

[13542] LOC285387 (Accession XP_209588.1) is another GAM88 target gene, herein designated TARGET GENE. LOC285387 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285387, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285387 BINDING SITE, designated SEQ ID:13211, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13543] Another function of GAM88 is therefore inhibition of LOC285387 (Accession XP_209588.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC285387.

[13544] LOC285992 (Accession XP_212126.1) is another GAM88 target gene, herein designated TARGET GENE. LOC285992 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285992, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285992 BINDING SITE, designated SEQ ID:16051, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13545] Another function of GAM88 is therefore inhibition of LOC285992 (Accession XP_212126.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285992.

[13546] LOC286047 (Accession XP_209872.1) is another GAM88 target gene, herein designated TARGET GENE. LOC286047 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286047, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC286047 BINDING SITE, designated SEQ ID:9088, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13547] Another function of GAM88 is therefore inhibition of LOC286047 (Accession XP_209872.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286047.

[13548] LOC286332 (Accession XP_212273.1) is another GAM88 target gene, herein designated TARGET GENE. LOC286332 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286332, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286332 BINDING SITE, designated SEQ ID:6130, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13549] Another function of GAM88 is therefore inhibition of LOC286332 (Accession XP_212273.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286332.

[13550] LOC286333 (Accession XP_212271.1) is another GAM88 target gene, herein designated TARGET GENE. LOC286333 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286333, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286333 BINDING SITE, designated SEQ ID:6130, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13551] Another function of GAM88 is therefore inhibition of LOC286333 (Accession XP_212271.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286333.

[13552] LOC338769 (Accession XP_294696.2) is another GAM88 target gene, herein designated TARGET GENE. LOC338769 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338769, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338769 BINDING SITE, designated SEQ ID:6075, to

the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13553] Another function of GAM88 is therefore inhibition of LOC338769 (Accession XP_294696.2) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338769.

[13554] LOC339556 (Accession XP_290951.1) is another GAM88 target gene, herein designated TARGET GENE. LOC339556 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339556, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339556 BINDING SITE, designated SEQ ID:8415, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13555] Another function of GAM88 is therefore inhibition of LOC339556 (Accession XP_290951.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339556.

[13556] LOC339832 (Accession XP_295079.1) is another GAM88

target gene, herein designated TARGET GENE. LOC339832 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339832, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339832 BINDING SITE, designated SEQ ID:3921, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13557] Another function of GAM88 is therefore inhibition of LOC339832 (Accession XP_295079.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339832.

[13558] LOC340269 (Accession XP_295199.1) is another GAM88 target gene, herein designated TARGET GENE. LOC340269 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340269, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340269 BINDING SITE, designated SEQ ID:4434, to the nucleotide sequence of GAM88 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:310.

[13559] Another function of GAM88 is therefore inhibition of LOC340269 (Accession XP_295199.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340269.

[13560] LOC341625 (Accession XP_296347.1) is another GAM88 target gene, herein designated TARGET GENE. LOC341625 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC341625, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC341625 BINDING SITE, designated SEQ ID:10681, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13561] Another function of GAM88 is therefore inhibition of LOC341625 (Accession XP_296347.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC341625.

[13562] LOC345484 (Accession XP_298816.1) is another GAM88 target gene, herein designated TARGET GENE. LOC345484

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC345484, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC345484 BINDING SITE, designated SEQ ID:6432, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13563] Another function of GAM88 is therefore inhibition of LOC345484 (Accession XP_298816.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC345484.

[13564] LOC347939 (Accession XP_029423.1) is another GAM88 target gene, herein designated TARGET GENE. LOC347939 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC347939, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347939 BINDING SITE, designated SEQ ID:14547, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13565] Another function of GAM88 is therefore inhibition of LOC347939 (Accession XP_029423.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347939.

[13566] LOC348474 (Accession XP_209299.2) is another GAM88 target gene, herein designated TARGET GENE. LOC348474 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348474, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348474 BINDING SITE, designated SEQ ID:7632, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13567] Another function of GAM88 is therefore inhibition of LOC348474 (Accession XP_209299.2) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348474.

[13568] LOC349059 (Accession XP_302946.1) is another GAM88 target gene, herein designated TARGET GENE. LOC349059 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC349059, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349059 BINDING SITE, designated SEQ ID:18214, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13569] Another function of GAM88 is therefore inhibition of LOC349059 (Accession XP_302946.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349059.

[13570] LOC349160 (Accession XP_302972.1) is another GAM88 target gene, herein designated TARGET GENE. LOC349160 BINDING SITE1 and LOC349160 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC349160, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349160 BINDING SITE1 and LOC349160 BINDING SITE2, designated SEQ ID:1659 and SEQ ID:18539 respectively, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also

designated SEQ ID:310.

[13571] Another function of GAM88 is therefore inhibition of LOC349160 (Accession XP_302972.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349160.

[13572] LOC90233 (Accession NP_612356.1) is another GAM88 target gene, herein designated TARGET GENE. LOC90233 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90233, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90233 BINDING SITE, designated SEQ ID:11676, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13573] Another function of GAM88 is therefore inhibition of LOC90233 (Accession NP_612356.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90233.

[13574] LOC91663 (Accession NP_612382.1) is another GAM88 target gene, herein designated TARGET GENE. LOC91663

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91663, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91663 BINDING SITE, designated SEQ ID:3125, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13575] Another function of GAM88 is therefore inhibition of LOC91663 (Accession NP_612382.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91663.

[13576] Mesoderm development candidate 2 (MESDC2, Accession XP_051854.1) is another GAM88 target gene, herein designated TARGET GENE. MESDC2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MESDC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MESDC2 BINDING SITE, designated SEQ ID:10030, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated

SEQ ID:310.

[13577] Another function of GAM88 is therefore inhibition of Mesoderm development candidate 2 (MESDC2, Accession XP_051854.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MESDC2.

[13578] MGC40579 (Accession NP_689989.1) is another GAM88 target gene, herein designated TARGET GENE. MGC40579 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC40579, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC40579 BINDING SITE, designated SEQ ID:17677, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13579] Another function of GAM88 is therefore inhibition of MGC40579 (Accession NP_689989.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC40579.

[13580] MGC47799 (Accession NP_775816.1) is another GAM88 target gene, herein designated TARGET GENE. MGC47799

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC47799, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC47799 BINDING SITE, designated SEQ ID:1116, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13581] Another function of GAM88 is therefore inhibition of MGC47799 (Accession NP_775816.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC47799.

[13582] NCYM (Accession NP_006307.1) is another GAM88 target gene, herein designated TARGET GENE. NCYM BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NCYM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NCYM BINDING SITE, designated SEQ ID:3893, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13583] Another function of GAM88 is therefore inhibition of NCYM (Accession NP_006307.1), a gene which may have a functional role during normal fetal development. Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCYM.

[13584] The function of NCYM has been established by previous studies. Krystal et al. (1990) demonstrated that antisense primary transcription of the MYCN oncogene (OMIM Ref. No. 164840) gives rise to stable polyadenylated transcripts. The antisense transcription unit, designated NCYM, has significant overlap with MYCN, but is expressed from the opposite DNA strand. After RNase protection and restriction mapping, Armstrong and Krystal (1992) identified a probe containing sequence unique to the MYCN locus antisense transcript and isolated an NCYM cDNA from a neuroblastoma cell line cDNA library. The deduced 109- amino acid, 12- kD NCYM protein is encoded by 3 exons. Armstrong and Krystal (1992) used RACE to identify 2 polyadenylation sites and multiple 5-prime ends, consistent with the results of RNase protection experiments. The predicted sequence contains a helix- loop- helix motif and a basic region, suggesting that

NCYM may function as a DNA- binding protein. By RT-PCR, Armstrong and Krystal (1992) detected NCYM expression at varying low levels in fetal tissues including brain, lung, liver, and kidney, suggesting a functional role during development. By Northern blot analysis, they detected NCYM expression at high levels in 2 neuroblastoma cell lines and in a small cell lung cancer cell line. All 3 of these cell lines also contained amplified MYCN. The expression of MYCN and NCYM also appeared to be coregulated in response to retinoic acid, leading Armstrong and Krystal (1992) to suggest that NCYM should invariably be amplified in tumors containing MYCN amplification.

[13585]

[13586] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13587] Armstrong, B. C.; Krystal, G. W. : Isolation and characterization of complementary DNA for N- cym, a gene encoded by the DNA strand opposite to N- myc. Cell Growth Differ. 3: 385- 390, 1992. ; and

[13588] Krystal, G. W.; Armstrong, B. C.; Battey, J. F. : N- myc mRNA forms an RNA- RNA duplex with endogenous antisense transcripts. Molec. Cell. Biol. 10: 4180- 4191,

1990.

[13589] Further studies establishing the function and utilities of NCYM are found in John Hopkins OMIM database record ID 605374, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nudix (nucleoside diphosphate linked moiety x)-type motif 4 (NUDT4, Accession NP_061967.2) is another GAM88 target gene, herein designated TARGET GENE. NUDT4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NUDT4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUDT4 BINDING SITE, designated SEQ ID:13312, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13590] Another function of GAM88 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety x)-type motif 4 (NUDT4, Accession NP_061967.2) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT4.

[13591] Protocadherin 10 (PCDH10, Accession NP_065866.1) is

another GAM88 target gene, herein designated TARGET GENE. PCDH10 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PCDH10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDH10 BINDING SITE, designated SEQ ID:17410, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13592] Another function of GAM88 is therefore inhibition of Protocadherin 10 (PCDH10, Accession NP_065866.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH10.

[13593] Protocadherin 10 (PCDH10, Accession NP_116586.1) is another GAM88 target gene, herein designated TARGET GENE. PCDH10 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PCDH10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDH10 BIND-

ING SITE, designated SEQ ID:17410, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13594] Another function of GAM88 is therefore inhibition of Protocadherin 10 (PCDH10, Accession NP_116586.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH10.

[13595] Protein o-fucosyltransferase 1 (POFUT1, Accession NP_056167.1) is another GAM88 target gene, herein designated TARGET GENE. POFUT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by POFUT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POFUT1 BINDING SITE, designated SEQ ID:1461, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13596] Another function of GAM88 is therefore inhibition of Protein o-fucosyltransferase 1 (POFUT1, Accession NP_056167.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with POFUT1.

[13597] PRO1768 (Accession NP_054818.1) is another GAM88 target gene, herein designated TARGET GENE. PRO1768 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO1768, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO1768 BINDING SITE, designated SEQ ID:3744, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13598] Another function of GAM88 is therefore inhibition of PRO1768 (Accession NP_054818.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1768.

[13599] Rab11a, member ras oncogene family (RAB11A, Accession NP_004654.1) is another GAM88 target gene, herein designated TARGET GENE. RAB11A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB11A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB11A BINDING SITE, desig-

nated SEQ ID:6694, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13600] Another function of GAM88 is therefore inhibition of Rab11a, member ras oncogene family (RAB11A, Accession NP_004654.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB11A.

[13601] Rna binding motif protein 3 (RBM3, Accession NP_006734.1) is another GAM88 target gene, herein designated TARGET GENE. RBM3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RBM3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBM3 BINDING SITE, designated SEQ ID:8083, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13602] Another function of GAM88 is therefore inhibition of Rna binding motif protein 3 (RBM3, Accession NP_006734.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM3.

[13603] Sarcoma amplified sequence (SAS, Accession NP_005972.1) is another GAM88 target gene, herein designated TARGET GENE. SAS BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SAS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SAS BINDING SITE, designated SEQ ID:15612, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13604] Another function of GAM88 is therefore inhibition of Sarcoma amplified sequence (SAS, Accession NP_005972.1), a gene which is a member of the transmembrane 4 superfamily (TM4SF) and may be involved in growth- related cellular processes T. Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAS.

[13605] The function of SAS has been established by previous studies. SAS is a member of the transmembrane 4 superfamily, all members of which have 4 hydrophobic domains. This family includes various tumor- associated antigens such as CO- 029 (OMIM Ref. No. 600769), L6 (M3S1; 191155), and ME491 (CD63; 155740), hematopoi-

etic cell antigens such as CD9 (OMIM Ref. No. 143030), CD53 (OMIM Ref. No. 151525), CD37 (OMIM Ref. No. 151523),and TAPA1 (OMIM Ref. No. 186845), as well as the parasitic trematode surface proteins Sm23 and Sj23. Meltzer et al. (1991) identified and partially cloned a gene that is amplified in human malignant fibrous histiocytoma. They demonstrated that the gene, designated sarcoma amplified sequence, is located on chromosome 12 by hybridization to a rodent/human somatic cell hybrid mapping panel. They further regionalized the assignment to 12q13- q14 by fluorescence in situ hybridization. This chromosomal region is commonly involved in rearrangements in myxoid liposarcoma, benign lipoma, and uterine leiomyoma. Meltzer et al. (1991) identified SAS amplification in 5 of 29 malignant fibrous histiocytoma biopsies, 4 of 12 liposarcoma biopsies, and 1 osteogenic sarcoma cell line. Since amplification of cellular oncogenes occurs frequently in human cancers, identification of amplified genes in tumor cells is a useful approach for understanding genetic alterations. Jankowski et al. (1995) characterized the genomic structure of SAS and showed that it has 6 exons spanning approximately 3.2 kb.

[13606]

[13607] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13608] Jankowski, S. A.; De Jong, P.; Meltzer, P. S. : Genomic structure of SAS, a member of the transmembrane 4 superfamily amplified in human sarcomas. Genomics 25: 501- 506, 1995. ; and

[13609] Meltzer, P. S.; Jankowski, S. A.; Dal Cin, P.; Sandberg, A. A.; Paz, I. B.; Coccia, M. A.; Smith, S. H. : Identification and cloning of a novel amplified DNA sequence in human malignant.

[13610] Further studies establishing the function and utilities of SAS are found in John Hopkins OMIM database record ID 181035, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sry (sex determining region y)-box 9 (campomelic dysplasia, autosomal sex-reversal) (SOX9, Accession NP_000337.1) is another GAM88 target gene, herein designated TARGET GENE. SOX9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SOX9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

SOX9 BINDING SITE, designated SEQ ID:9040, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13611] Another function of GAM88 is therefore inhibition of Sry (sex determining region y)-box 9 (campomelic dysplasia, autosomal sex-reversal) (SOX9, Accession NP_000337.1), a gene which regulates the expression of other genes involved in chondrogenesis. Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX9.

[13612] The function of SOX9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Taf1-like rna polymerase ii, tata box binding protein (tbp)-associated factor, 210kda (TAF1L, Accession NP_722516.1) is another GAM88 target gene, herein designated TARGET GENE. TAF1L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TAF1L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TAF1L BINDING SITE, designated SEQ ID:5793, to the nucleotide sequence of GAM88 RNA,

herein designated GAM RNA, also designated SEQ ID:310.

[13613] Another function of GAM88 is therefore inhibition of Taf1-like rna polymerase ii, tata box binding protein (tbp)-associated factor, 210kda (TAF1L, Accession NP_722516.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF1L.

[13614] TU12B1-TY (Accession NP_057659.1) is another GAM88 target gene, herein designated TARGET GENE. TU12B1-TY BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TU12B1-TY, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TU12B1-TY BINDING SITE, designated SEQ ID:16898, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13615] Another function of GAM88 is therefore inhibition of TU12B1-TY (Accession NP_057659.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU12B1-TY.

[13616] Ubiquitin specific protease 13 (isopeptidase t-3) (USP13,

Accession NP_003931.1) is another GAM88 target gene, herein designated TARGET GENE. USP13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by USP13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of USP13 BINDING SITE, designated SEQ ID:8813, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13617] Another function of GAM88 is therefore inhibition of Ubiquitin specific protease 13 (isopeptidase t-3) (USP13, Accession NP_003931.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP13.

[13618] Zinc finger protein 211 (ZNF211, Accession XP_290823.1) is another GAM88 target gene, herein designated TARGET GENE. ZNF211 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZNF211, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF211 BINDING

SITE, designated SEQ ID:8415, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13619] Another function of GAM88 is therefore inhibition of Zinc finger protein 211 (ZNF211, Accession XP_290823.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF211.

[13620] Zinc finger protein 211 (ZNF211, Accession NP_006376.1) is another GAM88 target gene, herein designated TARGET GENE. ZNF211 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZNF211, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF211 BINDING SITE, designated SEQ ID:8415, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13621] Another function of GAM88 is therefore inhibition of Zinc finger protein 211 (ZNF211, Accession NP_006376.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with ZNF211.

[13622]

[13623] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 89 (GAM89), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13624] GAM89 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM89 was detected is described hereinabove with reference to Figs. 8-15.

[13625] GAM89 gene, herein designated GAM GENE, and GAM89 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[13626] GAM89 gene encodes a GAM89 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM89 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM89 precursor RNA is designated SEQ ID:106, and is provided hereinbelow with reference to the sequence listing part.

[13627] GAM89 precursor RNA folds onto itself, forming GAM89 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13628] GAM89 precursor RNA folds onto itself, forming GAM89 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[13629] Nucleotide sequence of GAM89 precursor RNA, designated SEQ-ID: 106, and a schematic representation of a predicted secondary folding of GAM89 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[13630] An enzyme complex designated DICER COMPLEX, `dices` the GAM89 folded precursor RNA into GAM89 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM89 RNA is designated SEQ ID:235, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[13631] GAM89 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM89 target RNA, herein designated GAM TARGET RNA. GAM89 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13632] GAM89 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM89 target RNA, herein designated GAM TARGET RNA. This complementary binding is

due to the fact that the nucleotide sequence of GAM89 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM89 RNA may have a different number of target binding sites in untranslated regions of a GAM89 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13633] The complementary binding of GAM89 RNA, herein designated GAM RNA, to target binding sites on GAM89 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM89 target RNA into GAM89 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13634] It is appreciated that GAM89 target gene, herein desig-

nated TARGET GENE, in fact represents a plurality of GAM89 target genes. The mRNA of each one of this plurality of GAM89 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM89 RNA, herein designated GAM RNA, and which when bound by GAM89 RNA causes inhibition of translation of respective one or more GAM89 target proteins.

[13635] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM89 gene, herein designated GAM GENE, on one or more GAM89 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a

tiny RNA world, Science 294,779 (2001)).

[13636] It is appreciated that specific functions and accordingly utilities of GAM89 correlate with, and may be deduced from, the identity of the target genes which GAM89 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13637]

[13638]

[13639] Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NM_080550.1) is a GAM89 target gene, herein designated TARGET GENE. AP1GBP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP1GBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE, designated SEQ ID:17343, to the nucleotide sequence of GAM89 RNA, herein designated GAM RNA, also designated SEQ ID:235.

[13640] A function of GAM89 is therefore inhibition of Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NM_080550.1) . Accordingly, utilities of GAM89 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1.

[13641] KIAA1244 (Accession NM_020340.1) is another GAM89 target gene, herein designated TARGET GENE. KIAA1244 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1244, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1244 BINDING SITE, designated SEQ ID:5953, to the nucleotide sequence of GAM89 RNA, herein designated GAM RNA, also designated SEQ ID:235.

[13642] Another function of GAM89 is therefore inhibition of KIAA1244 (Accession NM_020340.1) . Accordingly, utilities of GAM89 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1244.

[13643] LOC153218 (Accession XM_087628.1) is another GAM89 target gene, herein designated TARGET GENE. LOC153218 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153218, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC153218 BINDING SITE, designated SEQ ID:1873, to the nucleotide sequence of GAM89 RNA, herein designated GAM RNA, also designated SEQ ID:235.

[13644] Another function of GAM89 is therefore inhibition of LOC153218 (Accession XM_087628.1) . Accordingly, utilities of GAM89 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153218.

[13645] LOC256691 (Accession) is another GAM89 target gene, herein designated TARGET GENE. LOC256691 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC256691, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256691 BINDING SITE, designated SEQ ID:16637, to the nucleotide sequence of GAM89 RNA, herein designated GAM RNA, also designated SEQ ID:235.

[13646] Another function of GAM89 is therefore inhibition of LOC256691 (Accession) . Accordingly, utilities of GAM89 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256691.

[13647]

[13648] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 90 (GAM90), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13649] GAM90 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM90 was detected is described hereinabove with reference to Figs. 8-15.

[13650] GAM90 gene, herein designated GAM GENE, and GAM90 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[13651] GAM90 gene encodes a GAM90 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM90 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM90 precursor RNA is designated SEQ ID:131, and is provided hereinbelow with reference to the sequence listing part.

[13652] GAM90 precursor RNA folds onto itself, forming GAM90

folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13653] GAM90 precursor RNA folds onto itself, forming GAM90 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[13654] Nucleotide sequence of GAM90 precursor RNA, designated SEQ-ID: 131, and a schematic representation of a predicted secondary folding of GAM90 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[13655] An enzyme complex designated DICER COMPLEX, `dices`

the GAM90 folded precursor RNA into GAM90 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM90 RNA is designated SEQ ID:374, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[13656] GAM90 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM90 target RNA, herein designated GAM TARGET RNA. GAM90 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13657] GAM90 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM90 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM90

RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM90 RNA may have a different number of target binding sites in untranslated regions of a GAM90 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13658] The complementary binding of GAM90 RNA, herein designated GAM RNA, to target binding sites on GAM90 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM90 target RNA into GAM90 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13659] It is appreciated that GAM90 target gene, herein designated TARGET GENE, in fact represents a plurality of

GAM90 target genes. The mRNA of each one of this plurality of GAM90 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM90 RNA, herein designated GAM RNA, and which when bound by GAM90 RNA causes inhibition of translation of respective one or more GAM90 target proteins.

[13660] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM90 gene, herein designated GAM GENE, on one or more GAM90 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13661] It is appreciated that specific functions and accordingly utilities of GAM90 correlate with, and may be deduced from, the identity of the target genes which GAM90 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13662]

[13663]

[13664] AF020591 (Accession NM_014480.1) is a GAM90 target gene, herein designated TARGET GENE. AF020591 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AF020591, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AF020591 BINDING SITE, designated SEQ ID:16052, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13665] A function of GAM90 is therefore inhibition of AF020591 (Accession NM_014480.1) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF020591.

[13666] BANP (Accession NM_017869.2) is another GAM90 target gene, herein designated TARGET GENE. BANP BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BANP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BANP BINDING SITE, designated SEQ ID:18199, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13667] Another function of GAM90 is therefore inhibition of BANP (Accession NM_017869.2) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BANP.

[13668] B-cell cll/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NM_001706.2) is another GAM90 target gene, herein designated TARGET GENE. BCL6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BCL6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL6 BINDING SITE, designated SEQ ID:9018, to the nu-

cleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13669] Another function of GAM90 is therefore inhibition of B-cell cll/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NM_001706.2), a gene which is involved in the generation and maintenance of both T and B cells during immune responses and therefore may be associated with B-cell non- hodgkin lymphoma, diffuse large cell lymphomas and follicular lymphomas. Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of B-cell non- hodgkin lymphoma, diffuse large cell lymphomas and follicular lymphomas, and of other diseases and clinical conditions associated with BCL6.

[13670] The function of BCL6 has been established by previous studies. Chromosomal translocations involving chromosome 3q27 and immunoglobulin gene regions are among the most common rearrangements in B- cell non-Hodgkin lymphoma. Using a probe from the immunoglobulin heavy chain joining region locus (OMIM Ref. No. 147010), Baron et al. (1993) isolated genomic clones from a bacteriophage lambda library prepared from a lymphoma characterized by a translocation t(3;14)(q27;q32). Normal chromosome 3 sequences and the reciprocal

breakpoint junction were isolated. DNA probes on each side of the chromosome 3 breakpoint hybridized at high stringency to the DNA of various mammalian species, demonstrating evolutionary conservation. A probe made from partial cDNA clones isolated from a T- cell line hybridized the genomic DNA from both sides of the chromosome 3 breakpoint, indicating that the t(3;14) is associated with a break within the gene on chromosome 3. In situ chromosomal hybridization revealed that the same gene is involved in the t(3;22)(q27;q11). Preliminary nucleotide sequencing showed no identity of the cDNA to gene sequences in available data banks. Baron et al. (1993) proposed the name B- cell lymphoma- 6 (BCL6) for this gene, which they presumed plays a role in the pathogenesis of certain B- cell lymphomas. Ye et al. (1993) cloned the BCL6 gene.

[13671] Animal model experiments lend further support to the function of BCL6. Ichii et al. (2002) observed that the percentage of CD8 (see OMIM Ref. No. 186910)- positive T cells with a memory phenotype was lower in Bcl6 - /- mice than in wildtype mice, while the percentage of activated T cells was the same. Transgenic mice and 'rescued' Bcl6 - /- mice expressing the Bcl6 transgene specifically

in T cells had levels of memory CD8 cells like those of wildtype mice. After antigenic stimulation, memory CD8 cells, which express CD44 (OMIM Ref. No. 107269), Ly6C (see OMIM Ref. No. LY6D; 606204), CD122 (OMIM Ref. No. 146710), and Bcl2 (OMIM Ref. No. 151430), differentiated into effector cells more rapidly than nonmemory CD8 cells in wildtype mice. Analysis of CD8- positive T- cell proliferation indicated that memory- type CD8 cells proliferated through a homeostatic mechanism in a Bcl6- dependent manner in the lymphopenic environment of very young mouse spleens. Ichii et al. (2002) concluded that BCL6 is involved in the generation and maintenance of both T and B cells during immune responses.

[13672] It is appreciated that the abovementioned animal model for BCL6 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[13673] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13674] Ye, B. H.; Rao, P. H.; Chaganti, R. S. K.; Dalla- Favera, R. : Cloning of bcl- 6, the locus involved in chromosome translocations affecting band 3q27 in B- cell lymphoma.

Cancer Res. 53: 2732- 2735, 1993. ; and

[13675] Ichii, H.; Sakamoto, A.; Hatano, M.; Okada, S.; Toyama, H.; Taki, S.; Arima, M.; Kuroda, Y.; Tokuhisa, T. : Role of Bcl-6 in the generation and maintenance of memory CD8+ T cells. Natu.

[13676] Further studies establishing the function and utilities of BCL6 are found in John Hopkins OMIM database record ID 109565, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cold autoinflammatory syndrome 1 (CIAS1, Accession NM_004895.2) is another GAM90 target gene, herein designated TARGET GENE. CIAS1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CIAS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CIAS1 BINDING SITE, designated SEQ ID:19841, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13677] Another function of GAM90 is therefore inhibition of Cold autoinflammatory syndrome 1 (CIAS1, Accession NM_004895.2), a gene which may mediate protein- protein interactions; contains a leucine rich repeat and there-

fore may be associated with Familial cold autoinflammatory syndrome, muckle- wells syndrome. Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of Familial cold autoinflammatory syndrome, muckle- wells syndrome, and of other diseases and clinical conditions associated with CIAS1.

[13678] The function of CIAS1 has been established by previous studies. In a positional cloning effort to identify the gene mutated in familial cold autoinflammatory syndrome and Muckle- Wells syndrome, both of which map to 1q44, Hoffman et al. (2001) cloned and characterized the CIAS1 gene, so named for 'cold- induced autoinflammatory syndrome.' The full- length cDNA corresponds to a 9- exon gene encoding an open reading frame of 3,105 basepairs with 2 potential start codons in exon 1, with the second start codon meeting more Kozak criteria, and a stop codon at exon 9. Northern blot analysis identified a broad mRNA band of approximately 4 kb expressed at a low level in peripheral blood leukocytes; little or no expression was detectable in other tissues. Further analysis revealed extensive alternative splicing of exons 4 through 8 that resulted in mRNAs ranging from 3,315 to 4,170 bp, consistent with the Northern blot analysis. The predicted

protein encoded by the first splice form of CIAS1 (exons 1- 3, 5, and 7- 9), called cryopyrin, consists of 920 amino acids with a size of 105.7 kD and a PI of 6.16. The protein sequence contains several distinct motifs including a pyrin domain in the amino terminus (amino acids 13 through 83), a central nucleotide- binding site (NACHT subfamily) domain in exon 3 (amino acids 217 to 533), and a C- terminal leucine- rich repeat domain containing 7 leucine-rich repeats (amino acids 697 through 920). No nuclear localization signals were identified and no clear transmembrane regions were found. The largest protein potentially encoded by the 9 exons of CIAS1 consists of 1,034 amino acids with a size of 117.9 kD and 11 C- terminal leucine- rich repeats. Hoffman et al. (2001) suggested that cryopyrin is a signaling protein involved in the regulation of apoptosis. Dode et al. (2002) identified CIAS1 mutations, all located in exon 3, in 9 unrelated families with MWS and in 3 unrelated families with familial cold urticaria (FCU), originating from France, England, and Algeria. Five mutations were novel. The R260W mutation (606416.0005) was identified in 2 families with MWS and in 2 families with FCU, of different ethnic origins, thereby demonstrating that a single CIAS1 mutation may cause

both syndromes. This result indicated that modifier genes are involved in determining either an MWS or an FCU phenotype. The finding of the G569R mutation (606416.0006) in asymptomatic individuals further emphasized the importance of a modifier gene (or genes) in determining disease phenotype. The authors suggested that identification of modifiers was likely to have significant therapeutic implications for these severe diseases.

[13679]

[13680] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13681] Dode, C.; Le Du, N.; Cuisset, L.; Letourneur, F.; Berthelot, J.- M.; Vaudour, G.; Meyrier, A.; Watts, R. A.; Scott, D. G. Am. J. Hum. Genet. 70: 1498- 1506, 2002. ; and

[13682] Hoffman, H. M.; Mueller, J. L.; Broide, D. H.; Wanderer, A. A.; Kolodner, R. D. : Mutation of a new gene encoding a putative pyrin- like protein causes familial cold autoin-

flammatory syn.

[13683] Further studies establishing the function and utilities of CIAS1 are found in John Hopkins OMIM database record ID 606416, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ccctc-binding factor (zinc finger protein)-like (CTCFL, Accession NM_080618.2) is another GAM90 target gene, herein designated TARGET GENE. CTCFL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTCFL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CTCFL BINDING SITE, designated SEQ ID:16845, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13684] Another function of GAM90 is therefore inhibition of Cctc-binding factor (zinc finger protein)-like (CTCFL, Accession NM_080618.2) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTCFL.

[13685] DKFZp434O0515 (Accession NM_178123.1) is another GAM90 target gene, herein designated TARGET GENE. DKFZp434O0515 BINDING SITE is a target binding site found

in the 5` untranslated region of mRNA encoded by DKFZp434O0515, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434O0515 BINDING SITE, designated SEQ ID:12460, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13686] Another function of GAM90 is therefore inhibition of DKFZp434O0515 (Accession NM_178123.1) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434O0515.

[13687] E2IG4 (Accession NM_015516.1) is another GAM90 target gene, herein designated TARGET GENE. E2IG4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by E2IG4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of E2IG4 BINDING SITE, designated SEQ ID:10835, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13688] Another function of GAM90 is therefore inhibition of E2IG4 (Accession NM_015516.1) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2IG4.

[13689] Estrogen receptor binding site associated, antigen, 9 (EBAG9, Accession NM_004215.2) is another GAM90 target gene, herein designated TARGET GENE. EBAG9 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by EBAG9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EBAG9 BINDING SITE, designated SEQ ID:768, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13690] Another function of GAM90 is therefore inhibition of Estrogen receptor binding site associated, antigen, 9 (EBAG9, Accession NM_004215.2), a gene which suppresses cell proliferation and induces apoptotic cell death and therefore may be associated with Cancer and tumor invasiveness. Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of Cancer and tumor invasiveness, and of other diseases and clinical conditions

associated with EBAG9.

[13691] The function of EBAG9 has been established by previous studies. Watanabe et al. (1998) used the CpG- GBS (genomic binding site) method to isolate novel estrogen-responsive genes. By screening a breast cancer cDNA library with the ESR- binding fragments isolated from the CpG island library, they isolated cDNAs encoding EBAG9, GRIN2D (OMIM Ref. No. 602717), and COX7A2L (OMIM Ref. No. 605771), which the authors termed EB9, EB11, and EB1 (or COX7RP), respectively. EBAG9 encodes a deduced 214- amino acid protein. Northern blot analysis revealed expression of a 1.8- kb transcript in endometrial carcinoma and breast cancer cell lines and, to a lesser extent, in an osteosarcoma cell line. Gel mobility shift analysis confirmed that the ERE of EBAG9 binds to ESR. Northern blot analysis detected an upregulation of EBAG9 after estrogen treatment of a breast cancer cell line. Ikeda et al. (2000) noted that EBAG9 is identical with RCAS1, a human cancer cell surface antigen isolated by Nakashima et al. (1999). Ikeda et al. (2000) determined that the 5- prime flanking region of EBAG9 is 65% GC- rich, lacks a TATA motif, and contains a perfect palindromic ERE element at -60 to - 48 upstream of the transcription initiation site.

Promoter analysis revealed that the ERE- containing region can respond to estrogen in a breast cancer cell line. Electrophoretic mobility shift and supershift analysis demonstrated that ESR1 (OMIM Ref. No. 133430) is involved in binding to the ERE element.

[13692]

[13693] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13694] Watanabe, T.; Inoue, S.; Hiroi, H.; Orimo, A.; Kawashima, H.; Muramatsu, M. : Isolation of estrogen- responsive genes with a CpG island library. Molec. Cell. Biol. 18: 442-449, 1998. ; and

[13695] Ikeda, K.; Sato, M.; Tsutsumi, O.; Tsuchiya, F.; Tsuneizumi, M.; Emi, M.; Imoto, I.; Inazawa, J.; Muramatsu, M.; Inoue, S. : Promoter analysis and chromosomal mapping of human EBAG9 gene.

[13696] Further studies establishing the function and utilities of EBAG9 are found in John Hopkins OMIM database record ID 605772, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ13964 (Accession) is another GAM90 target gene, herein designated TARGET GENE. FLJ13964 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by FLJ13964, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13964 BINDING SITE, designated SEQ ID:10501, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13697] Another function of GAM90 is therefore inhibition of FLJ13964 (Accession) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13964.

[13698] FLJ21916 (Accession) is another GAM90 target gene, herein designated TARGET GENE. FLJ21916 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21916, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21916 BINDING SITE, designated SEQ ID:6125, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13699] Another function of GAM90 is therefore inhibition of

FLJ21916 (Accession) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21916.

[13700] Grb2-associated binding protein 2 (GAB2, Accession NM_080491.1) is another GAM90 target gene, herein designated TARGET GENE. GAB2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE, designated SEQ ID:12509, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13701] Another function of GAM90 is therefore inhibition of Grb2-associated binding protein 2 (GAB2, Accession NM_080491.1), a gene which act as adapters for transmitting various signals. Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2.

[13702] The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM63.1.Glycoprotein a repetitions predominant (GARP, Accession NM_005512.1) is another GAM90 target gene, herein designated TARGET GENE. GARP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GARP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GARP BINDING SITE, designated SEQ ID:10589, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13703] Another function of GAM90 is therefore inhibition of Glycoprotein a repetitions predominant (GARP, Accession NM_005512.1) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GARP.

[13704] HCC8 (Accession NM_016516.1) is another GAM90 target gene, herein designated TARGET GENE. HCC8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HCC8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HCC8 BIND-

ING SITE, designated SEQ ID:19979, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13705] Another function of GAM90 is therefore inhibition of HCC8 (Accession NM_016516.1) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCC8.

[13706] HMP19 (Accession NM_015980.1) is another GAM90 target gene, herein designated TARGET GENE. HMP19 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HMP19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HMP19 BINDING SITE, designated SEQ ID:1334, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13707] Another function of GAM90 is therefore inhibition of HMP19 (Accession NM_015980.1) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMP19.

[13708] Interferon regulatory factor 1 (IRF1, Accession NM_002198.1) is another GAM90 target gene, herein des-

ignated TARGET GENE. IRF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IRF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IRF1 BINDING SITE, designated SEQ ID:622, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13709] Another function of GAM90 is therefore inhibition of Interferon regulatory factor 1 (IRF1, Accession NM_002198.1), a gene which specifically binds to the upstream regulatory region of type i ifn and ifn- inducible mhc class i genes and therefore may be associated with Gastric cancer. Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of Gastric cancer, and of other diseases and clinical conditions associated with IRF1.

[13710] The function of IRF1 has been established by previous studies. In the course of studies of the regulation of type I interferon gene expression (147660, 147640), Miyamoto et al. (1988) identified a nuclear factor, termed interferon regulatory factor- 1 (IRF1), that binds to the upstream cis elements of both the interferon- alpha and the interferon-

beta genes. It was found that IRF1 functions as a transcriptional activator for the type I IFN genes (Harada et al., 1990). Harada et al. (1989) found that another factor, IRF2 (OMIM Ref. No. 147576), apparently antagonizes the IRF1 effect by competing for the same cis elements. By linkage studies using RFLPs, the IRF1 gene was assigned to 5q23-q31. To assess the possible role of IRF1 in the regulation of cell growth and differentiation, Yamada et al. (1991) generated transgenic mice carrying the human IRF1 gene, the constitutive expression of which was driven at a high level by the juxtaposed human immunoglobulin heavy-chain enhancer. They found that these transgenic mice showed a dramatic reduction in the number of B lymphocytes. Itoh et al. (1991) also mapped IRF1 to chromosome 5 by analysis of mouse- human somatic cell hybrids. Loss of heterozygosity (LOH) at the IRF1 locus occurs frequently in human gastric cancer (OMIM Ref. No. 137215) (Tamura et al., 1996). Nozawa et al. (1998) identified a point mutation in a human gastric cancer cell line (147575.0001) that changed methionine at codon 8 to leucine and produced an IRF1 protein with reduced transcriptional activity, but unaltered DNA- binding activity. In addition, Harada et al. (1994) had observed alternative

splicing of IRF1 mRNA, producing nonfunctional IRF1 protein at high frequencies in patients with myelodysplastic syndrome and acute myelogenous leukemia

[13711] Animal model experiments lend further support to the function of IRF1. Ko et al. (2002) noted that Irf1 - /- mice are deficient in Inos (OMIM Ref. No. 163730), Il12b (OMIM Ref. No. 161561), Cd8 (see OMIM Ref. No. 186910)- positive T cells, and natural killer (NK) cells, whereas Irf2 - /- mice are deficient in NK cells and have dysregulated Il12b induction. Icsbp (OMIM Ref. No. 601565) - /- mice are deficient in Il12b, Irf2, and reactive oxygen intermediates (ROIs). The Irf1, Irf2, and Icsbp genes are all inducible by gamma- interferon (Ifng; 147570). Irf1-, Irf2-, and Icsbp-deficient mouse strains have varying susceptibility to different intracellular bacterial and protozoan pathogens. Ko et al. (2002) determined that Irf1 - /- mice are highly susceptible to fatal liver damage from Brucella abortus, the causative agent of brucellosis, which manifests as arthritis, endocarditis, and meningitis in humans. In contrast, Irf2 - /- mice are highly resistant to Brucella, whereas Icsbp - /- mice maintain a plateau of infection similar to that seen in Il12b - /- mice. The authors concluded that IL12, reactive nitrogen intermediates, and

ROIs are probably crucial immune components in resistance to Brucella infection.

[13712] It is appreciated that the abovementioned animal model for IRF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[13713] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13714] Yamada, G.; Ogawa, M.; Akagi, K.; Miyamoto, H.; Nakano, N.; Itoh, S.; Miyazaki, J.; Nishikawa, S.; Yamamura, K.; Taniguchi, T. : Specific depletion of the B- cell population induced by aberrant expression of human interferon regulatory factor 1 gene in transgenic mice. Proc. Nat. Acad. Sci. 88: 532- 536, 1991. ; and

[13716] Further studies establishing the function and utilities of IRF1 are found in John Hopkins OMIM database record ID 147575, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0280

(Accession XM_166238.1) is another GAM90 target gene, herein designated TARGET GENE. KIAA0280 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0280, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0280 BINDING SITE, designated SEQ ID:5713, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13717] Another function of GAM90 is therefore inhibition of KIAA0280 (Accession XM_166238.1) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0280.

[13718] KIAA1219 (Accession XM_028835.7) is another GAM90 target gene, herein designated TARGET GENE. KIAA1219 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1219, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1219 BINDING SITE, designated SEQ ID:9549, to the

nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13719] Another function of GAM90 is therefore inhibition of KIAA1219 (Accession XM_028835.7) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1219.

[13720] KIAA1340 (Accession XM_044836.7) is another GAM90 target gene, herein designated TARGET GENE. KIAA1340 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1340, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1340 BINDING SITE, designated SEQ ID:17198, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13721] Another function of GAM90 is therefore inhibition of KIAA1340 (Accession XM_044836.7) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1340.

[13722] KIAA1715 (Accession XM_042834.2) is another GAM90

target gene, herein designated TARGET GENE. KIAA1715 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1715, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1715 BINDING SITE, designated SEQ ID:2627, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13723] Another function of GAM90 is therefore inhibition of KIAA1715 (Accession XM_042834.2) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1715.

[13724] LOC124446 (Accession XM_058805.5) is another GAM90 target gene, herein designated TARGET GENE. LOC124446 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC124446, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC124446 BINDING SITE, designated SEQ ID:14538, to the nucleotide sequence of GAM90 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:374.

[13725] Another function of GAM90 is therefore inhibition of LOC124446 (Accession XM_058805.5) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124446.

[13726] LOC147685 (Accession) is another GAM90 target gene, herein designated TARGET GENE. LOC147685 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147685, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147685 BINDING SITE, designated SEQ ID:15549, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13727] Another function of GAM90 is therefore inhibition of LOC147685 (Accession) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147685.

[13728] LOC148508 (Accession) is another GAM90 target gene, herein designated TARGET GENE. LOC148508 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by LOC148508, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148508 BINDING SITE, designated SEQ ID:16878, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13729] Another function of GAM90 is therefore inhibition of LOC148508 (Accession) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148508.

[13730] LOC150998 (Accession) is another GAM90 target gene, herein designated TARGET GENE. LOC150998 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150998, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150998 BINDING SITE, designated SEQ ID:18871, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13731] Another function of GAM90 is therefore inhibition of LOC150998 (Accession) . Accordingly, utilities of GAM90

include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150998.

[13732] LOC159199 (Accession) is another GAM90 target gene, herein designated TARGET GENE. LOC159199 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC159199, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC159199 BINDING SITE, designated SEQ ID:16647, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13733] Another function of GAM90 is therefore inhibition of LOC159199 (Accession) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159199.

[13734] LOC199786 (Accession) is another GAM90 target gene, herein designated TARGET GENE. LOC199786 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC199786, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC199786 BINDING SITE, designated SEQ ID:5506, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13735] Another function of GAM90 is therefore inhibition of LOC199786 (Accession) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199786.

[13736] LOC200205 (Accession XM_114152.1) is another GAM90 target gene, herein designated TARGET GENE. LOC200205 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200205, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200205 BINDING SITE, designated SEQ ID:13733, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13737] Another function of GAM90 is therefore inhibition of LOC200205 (Accession XM_114152.1) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200205.

[13738] LOC220522 (Accession XM_018306.6) is another GAM90

target gene, herein designated TARGET GENE. LOC220522 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220522, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220522 BINDING SITE, designated SEQ ID:10285, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13739] Another function of GAM90 is therefore inhibition of LOC220522 (Accession XM_018306.6) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220522.

[13740] LOC222803 (Accession) is another GAM90 target gene, herein designated TARGET GENE. LOC222803 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC222803, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222803 BINDING SITE, designated SEQ ID:2424, to the nucleotide sequence of GAM90 RNA, herein designated

GAM RNA, also designated SEQ ID:374.

[13741] Another function of GAM90 is therefore inhibition of LOC222803 (Accession) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222803.

[13742] LOC254132 (Accession) is another GAM90 target gene, herein designated TARGET GENE. LOC254132 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC254132, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254132 BINDING SITE, designated SEQ ID:16296, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13743] Another function of GAM90 is therefore inhibition of LOC254132 (Accession) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254132.

[13744] LOC257554 (Accession) is another GAM90 target gene, herein designated TARGET GENE. LOC257554 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC257554, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257554 BINDING SITE, designated SEQ ID:13098, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13745] Another function of GAM90 is therefore inhibition of LOC257554 (Accession) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257554.

[13746] LOC51279 (Accession NM_016546.1) is another GAM90 target gene, herein designated TARGET GENE. LOC51279 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51279, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51279 BINDING SITE, designated SEQ ID:954, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13747] Another function of GAM90 is therefore inhibition of LOC51279 (Accession NM_016546.1) . Accordingly, utilities of GAM90 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC51279.

[13748] LOC80298 (Accession NM_025198.2) is another GAM90 target gene, herein designated TARGET GENE. LOC80298 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC80298, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC80298 BINDING SITE, designated SEQ ID:18667, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13749] Another function of GAM90 is therefore inhibition of LOC80298 (Accession NM_025198.2) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC80298.

[13750] LOC91660 (Accession) is another GAM90 target gene, herein designated TARGET GENE. LOC91660 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91660, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of LOC91660 BINDING SITE, designated SEQ ID:10541, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13751] Another function of GAM90 is therefore inhibition of LOC91660 (Accession) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91660.

[13752] MGC1203 (Accession NM_024296.1) is another GAM90 target gene, herein designated TARGET GENE. MGC1203 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC1203, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC1203 BINDING SITE, designated SEQ ID:6223, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13753] Another function of GAM90 is therefore inhibition of MGC1203 (Accession NM_024296.1) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1203.

[13754] MGC3035 (Accession NM_024293.1) is another GAM90 target gene, herein designated TARGET GENE. MGC3035 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC3035, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3035 BINDING SITE, designated SEQ ID:11606, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13755] Another function of GAM90 is therefore inhibition of MGC3035 (Accession NM_024293.1) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3035.

[13756] MIR16 (Accession NM_016641.2) is another GAM90 target gene, herein designated TARGET GENE. MIR16 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MIR16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MIR16 BINDING SITE, designated SEQ ID:3695, to the nucleotide se-

quence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13757] Another function of GAM90 is therefore inhibition of MIR16 (Accession NM_016641.2), a gene which is a membrane interacting protein. Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIR16.

[13758] The function of MIR16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Nuclear factor (erythroid-derived 2)-like 1 (NFE2L1, Accession NM_003204.1) is another GAM90 target gene, herein designated TARGET GENE. NFE2L1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NFE2L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFE2L1 BINDING SITE, designated SEQ ID:19520, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13759] Another function of GAM90 is therefore inhibition of Nuclear factor (erythroid-derived 2)-like 1 (NFE2L1, Acces-

sion NM_003204.1), a gene which may regulate expression of ferritin genes. Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFE2L1.

[13760] The function of NFE2L1 has been established by previous studies. Chan et al. (1993) devised a complementation assay in yeast to clone mammalian transcription activators and used it to identify a distinct human bZIP transcription factor, NFE2L1, which they designated NRF1 (NFE2- related factor- 1) because of its similarities to NFE2 (OMIM Ref. No. 601490). Chan et al. (1995) showed that the NFE2L1 gene encodes a 742- amino acid protein with a different molecular weight than either the p45 subunit (NFE2) or the Maf protein subunit (MafF, MafG (OMIM Ref. No. 602020), or MafK (OMIM Ref. No. 600197)) of nuclear factor erythroid- 2. Chan et al. (1993) found that NFE2L1 activates transcription via NFE2- binding sites in yeast cells. The ubiquitous expression pattern of NFE2L1 and the range of promoters containing the NFE2- binding motif suggested that this gene may play a role in the regulation of heme synthesis and ferritin genes

[13761] Animal model experiments lend further support to the function of NFE2L1. To determine the function of Nrf1,

Chan et al. (1998) disrupted the mouse gene by homologous recombination. Heterozygous Nfr1 mutant mice developed normally, were fertile, and showed no obvious abnormalities. Mice homozygous for the Nrf1 mutation suffered from anemia as a result of abnormal fetal liver erythropoiesis and died in utero at mid- late gestation. The authors did not detect defects in globin gene expression. Abnormal red cell production appeared to result from a defect in the fetal liver microenvironment specific for erythroid cells. Chan et al. (1998) suggested that target genes regulated by Nrf1 play an essential role during fetal liver hematopoiesis.

[13762] It is appreciated that the abovementioned animal model for NFE2L1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[13763] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13764] Chan, J. Y.; Kwong, M.; Lu, R.; Chang, J.; Wang, B.; Yen, T. S. B.; Kan, Y. W. : Targeted disruption of the ubiquitous CNC- bZIP transcription factor, Nrf- 1, results in anemia and embryonic lethality in mice. EMBO J. 17: 1779- 1787,

1998. ; and

[13765] Chan, J. Y.; Han, X.- L.; Kan, Y. W. : Cloning of Nrf1, an NF- E2- related transcription factor, by genetic selection in yeast. Proc. Nat. Acad. Sci. 90: 11371- 11375, 1993.

[13766] Further studies establishing the function and utilities of NFE2L1 are found in John Hopkins OMIM database record ID 163260, and in cited publications listed in Table 5, which are hereby incorporated by reference.Neuroligin 1 (NLGN1, Accession NM_014932.1) is another GAM90 target gene, herein designated TARGET GENE. NLGN1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NLGN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NLGN1 BINDING SITE, designated SEQ ID:8799, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13767] Another function of GAM90 is therefore inhibition of Neuroligin 1 (NLGN1, Accession NM_014932.1), a gene which may trigger the de novo formation of presynaptic structure. Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with NLGN1.

[13768] The function of NLGN1 has been established by previous studies. Neurexins (see OMIM Ref. No. NRXN1; 600565) are neuronal cell surface proteins first identified in rat brain with hundreds of isoforms generated by alternative splicing. Ichtchenko et al. (1995) described neuroligin I, a neuronal cell surface protein that is enriched in rat synaptic plasma membranes and acts as a splice site- specific ligand for beta- neurexins. (Each of 3 genes encoding neurexins- - NRXN1, NRXN2, and NRXN3- - has 2 independent promoters and generates 2 classes of mRNAs. The longer mRNAs encode alpha- neurexins and the shorter mRNAs beta- neurexins.) Neuroligin I binds to beta- neurexins only if they lack an insert in the alternatively spliced sequence of the G domain, and not if they contain an insert. The extracellular sequence of rat neuroligin I is composed of a catalytically inactive esterase domain homologous to acetylcholinesterase. Ichtchenko et al. (1995) used in situ hybridization to demonstrate that alternative splicing of neurexins at the binding site recognized by neuroligin I is highly regulated. These findings support a model whereby alternative splicing of neurexins creates a family of cell surface receptors that

confer interactive specificity on their resident neurons. Using an in vitro system, Scheiffele et al. (2000) demonstrated that mouse neuroligin- 1 and - 2, postsynaptically localized proteins, can trigger the de novo formation of presynaptic structure. Nonneuronal cells engineered to express neuroligins induced morphologic and functional presynaptic differentiation in contacting axons. This activity could be inhibited by addition of a soluble version of beta- neurexin. Furthermore, addition of soluble beta-neurexin to a coculture of defined pre- and postsynaptic central nervous system (CNS) neurons inhibited synaptic vesicle clustering in axons contacting target neurons. These results suggested that neuroligins are part of the machinery employed during the formation and remodeling of CNS synapses.

[13769]

[13770] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13771] Ichtchenko, K.; Hata, Y.; Nguyen, T.; Ullrich, B.; Missler, M.; Moomaw, C.; Sudhof, T. C. : Neuroligin 1: a splice site- specific ligand for beta- neurexins. Cell 81: 435-443, 1995. ; and

[13772] Scheiffele, P.; Fan, J.; Choih, J.; Fetter, R.; Serafini, T. : Neuroligin expressed in nonneuronal cells triggers presynaptic development in contacting axons. Cell 101: 657-669, 2000.

[13773] Further studies establishing the function and utilities of NLGN1 are found in John Hopkins OMIM database record ID 600568, and in cited publications listed in Table 5, which are hereby incorporated by reference.Neurexin 2 (NRXN2, Accession NM_138732.1) is another GAM90 target gene, herein designated TARGET GENE. NRXN2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NRXN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NRXN2 BINDING SITE, designated SEQ ID:10578, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13774] Another function of GAM90 is therefore inhibition of Neurexin 2 (NRXN2, Accession NM_138732.1), a gene which may be involved in cell recognition, cell adhesion, and may mediate intracellular signaling. Accordingly, utilities of GAM90 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with NRXN2.

[13775] The function of NRXN2 has been established by previous studies. Neurexins are polymorphic cell surface proteins that are expressed in neurons. Neurexin II is 1 of 3 rat neurexin genes identified by Ushkaryov et al. (1992). Each gene contains 2 promoters that direct synthesis of alpha- and beta- neurexins. By analysis of a 1.2- Mb region flanking the MEN1 (OMIM Ref. No. 131100) locus on 11q13, Bergman et al. (1999) identified MCG36, a human gene similar to rat neurexin II- alpha. By genomic sequence analysis, Tabuchi and Sudhof (2002) determined that the NRXN2 gene contains 23 exons, has very large introns, and spans 106 kb, making it a relatively small gene compared to NRXN1 (OMIM Ref. No. 600565) and NRXN3. Exon 1 is more than 2 kb and encodes the first LNS domain and the first EGF- like repeat of alpha-neurexins. Other exons are average in size, with the remaining LNS domains interrupted by at least 1 intron, whereas all EGF- like repeats are encoded in single exons. The last exon, also relatively large, encodes the transmembrane region and cytoplasmic tail. Tabuchi and Sudhof (2002) also described a number of neurexin splice

sites.

[13776]

[13777] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13778] Bergman, L.; Silins, G.; Grimmond, S.; Hummerich, H.; Stewart, C.; Little, P.; Hayward, N. : A 500- kb sequence-ready cosmid contig and transcript map of the MEN1 region on 11q13. Genomics 55: 49- 56, 1999. ; and

[13779] Tabuchi, K.; Sudhof, T. C. : Structure and evolution of neurexin genes: insight into the mechanism of alternative splicing. Genomics 79: 849- 859, 2002.

[13780] Further studies establishing the function and utilities of NRXN2 are found in John Hopkins OMIM database record ID 600566, and in cited publications listed in Table 5, which are hereby incorporated by reference.Numb homolog (drosophila) (NUMB, Accession NM_003744.3) is another GAM90 target gene, herein designated TARGET GENE. NUMB BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NUMB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of NUMB BINDING SITE, designated SEQ ID:13662, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13781] Another function of GAM90 is therefore inhibition of Numb homolog (drosophila) (NUMB, Accession NM_003744.3), a gene which may act in generating asymmetric cell division during neurogenesisand is strongly similar to murine Numb. Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUMB.

[13782] The function of NUMB has been established by previous studies. During Drosophila neurogenesis, differential partitioning of the 'Numb' (dNumb) gene product is necessary for daughter cells to adopt distinct fates. Numb is thought to act by causing a bias in the cell- cell interaction mediated by Notch (see OMIM Ref. No. JAG2; 602570). Zhong et al. (1996) isolated cDNAs encoding mouse Numb (mNumb). The N- terminal region of the deduced 593-amino acid mouse protein contains a predicted phosphotyrosine- binding domain and shares 63% identity with dNumb. The C- terminal half shows little similarity with dNumb and includes a proline- rich segment with potential SH3- binding sites. Immunofluorescence experiments

revealed that mNumb is asymmetrically localized to the apical membrane of dividing ventricular neural progenitors during mouse cortical neurogenesis. However, unlike dNumb, there was no correlation between cleavage planes and mNumb localization at the apical cell membrane in anaphase ventricular cells. Zhong et al. (1996) expressed mNumb in Drosophila embryos and found that it localized asymmetrically in dividing neural precursors and rescued the Numb mutant phenotype. Yeast 2- hybrid assays and in vitro binding experiments demonstrated that mNumb can physically interact with the intracellular domain of mouse Notch1 (OMIM Ref. No. 190198). The authors concluded that shared molecular mechanisms generate asymmetric cell divisions during neurogenesis of vertebrates and invertebrates. Salcini et al. (1997) reported that both the NUMB and NUMB- like (NUMBL; 604018) proteins bind to the EH protein- protein interaction domain found in EPS15 (OMIM Ref. No. 600051) and other proteins. Coimmunoprecipitation studies demonstrated that NUMB and EPS15 are associated in vivo. This association appears to be mediated by an interaction between the EH domain of EPS15 and an asn- pro- phe (NPF) motif located near the C terminus of NUMB.

[13783]

[13784] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13785] Salcini, A. E.; Confalonieri, S.; Doria, M.; Santolini, E.; Tassi, E.; Minenkova, O.; Cesareni, G.; Pelicci, P. G.; Di Fiore, P. P. : Binding specificity and in vivo targets of the EH domain, a novel protein- protein interaction module. Genes Dev. 11: 2239- 2249, 1997. ; and

[13787] Further studies establishing the function and utilities of NUMB are found in John Hopkins OMIM database record ID 603728, and in cited publications listed in Table 5, which are hereby incorporated by reference.Parvin, alpha (PARVA, Accession NM_018222.2) is another GAM90 target gene, herein designated TARGET GENE. PARVA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PARVA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of PARVA BINDING SITE, designated SEQ ID:14808, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13788] Another function of GAM90 is therefore inhibition of Parvin, alpha (PARVA, Accession NM_018222.2) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARVA.

[13789] PRO1496 (Accession NM_018603.1) is another GAM90 target gene, herein designated TARGET GENE. PRO1496 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO1496, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO1496 BINDING SITE, designated SEQ ID:1444, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13790] Another function of GAM90 is therefore inhibition of PRO1496 (Accession NM_018603.1) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1496.

[13791] Protein tyrosine phosphatase, receptor type, t (PTPRT, Accession NM_007050.3) is another GAM90 target gene, herein designated TARGET GENE. PTPRT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTPRT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPRT BINDING SITE, designated SEQ ID:2885, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13792] Another function of GAM90 is therefore inhibition of Protein tyrosine phosphatase, receptor type, t (PTPRT, Accession NM_007050.3) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRT.

[13793] V-rel reticuloendotheliosis viral oncogene homolog b, nuclear factor of kappa light polypeptide gene enhancer in b-cells 3 (avian) (RELB, Accession NM_006509.1) is another GAM90 target gene, herein designated TARGET GENE. RELB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RELB, corresponding to a target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RELB BINDING SITE, designated SEQ ID:9956, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13794] Another function of GAM90 is therefore inhibition of V-rel reticuloendotheliosis viral oncogene homolog b, nuclear factor of kappa light polypeptide gene enhancer in b-cells 3 (avian) (RELB, Accession NM_006509.1) . Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RELB.

[13795] Rho-associated, coiled-coil containing protein kinase 2 (ROCK2, Accession NM_004850.2) is another GAM90 target gene, herein designated TARGET GENE. ROCK2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ROCK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ROCK2 BINDING SITE, designated SEQ ID:4807, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13796] Another function of GAM90 is therefore inhibition of Rho-associated, coiled-coil containing protein kinase 2 (ROCK2, Accession NM_004850.2), a gene which regulates cytokinesis, smooth muscle contraction, the formation of actin stress fibers and focal adhesions. Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROCK2.

[13797] The function of ROCK2 has been established by previous studies. ROCK2 is a serine/threonine kinase that regulates cytokinesis, smooth muscle contraction, the formation of actin stress fibers and focal adhesions, and the activation of the c- fos (OMIM Ref. No. 164810) serum response element. ROCK2, which is an isozyme of ROCK1 (OMIM Ref. No. 601702), is a target for the small GTPase Rho (e.g., 165390). Nakamura et al. (2001) studied the role of Rho in the migration of corneal epithelial cells in rabbit. They detected both ROCK1 (OMIM Ref. No. 601702) and ROCK2 in the corneal epithelium at protein and mRNA levels. They found that exoenzyme C3, a Rho inhibitor, inhibits corneal epithelial migration in a dose- dependent manner and prevents the stimulatory effect of the Rho activator lysophosphatidic acid (LPA). Both cytochalasin B, an in-

hibitor of actin filament assembly, and ML7, an inhibitor of myosin light chain kinase, also prevent LPA stimulation of epithelial migration. The authors suggested that Rho mediates corneal epithelial migration in response to external stimuli by regulating the organization of the actin cytoskeleton. Rao et al. (2001) investigated the role of Rho kinase in the modulation of aqueous humor outflow facility. The treatment of human trabecular meshwork and canal of Schlemm cells with a Rho kinase- specific inhibitor led to significant but reversible changes in cell shape and decreased actin stress fibers, focal adhesions, and protein phosphotyrosine staining. Based on the Rho kinase inhibitor- induced changes in myosin light chain phosphorylation and actomyosin organization, the authors suggested that cellular relaxation and loss of cell- substratum adhesions in the human trabecular meshwork and canal of Schlemm cells could result in either increased paracellular fluid flow across the canal of Schlemm or altered flow pathway through the juxtacanalicular tissue, thereby lowering resistance to outflow. They suggested Rho kinase as a potential target for the development of drugs to modulate intraocular pressure in glaucoma patients.

[13802] Further studies establishing the function and utilities of ROCK2 are found in John Hopkins OMIM database record ID 604002, and in cited publications listed in Table 5, which are hereby incorporated by reference.Wingless-type mmtv integration site family, member 10b (WNT10B, Accession NM_003394.2) is another GAM90 target gene, herein designated TARGET GENE. WNT10B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WNT10B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of WNT10B BINDING SITE, designated SEQ ID:5168, to the nucleotide sequence of GAM90 RNA, herein designated GAM RNA, also designated SEQ ID:374.

[13803] Another function of GAM90 is therefore inhibition of Wingless-type mmtv integration site family, member 10b (WNT10B, Accession NM_003394.2), a gene which is a ligand for members of the frizzled family of seven transmembrane receptors and may be a signaling molecule. Accordingly, utilities of GAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT10B.

[13804] The function of WNT10B has been established by previous studies. Several members of the Wnt gene family have been shown to cause mammary tumors in mice. Using degenerate primer PCR on human genomic DNA and specific PCR of cDNA libraries, Bui et al. (1997) isolated a Wnt gene that had not previously been described in human. It is the human homolog of mouse Wnt10b, which had been shown to be one of the oncogenes cooperating with FGF3 (OMIM Ref. No. 164950) in the development of mouse mammary tumor virus (MMTV)- induced mammary carcinomas in mice. The human WNT10B sequence is 88 and

95% identical to the murine gene at nucleotide and amino acid levels, respectively. By YAC and fluorescence in situ hybridization (FISH) mapping, Bui et al. (1997) localized the gene to 12q13, a chromosomal region frequently rearranged in human tumors and also containing the WNT1 gene (OMIM Ref. No. 164820). WNT10B expression was not observed in normal and benign proliferations of human breast tissue but was found to be elevated in 3 of 50 primary breast carcinomas. Southern blot analysis of the carcinoma expressing the highest level of WNT10B showed no amplification or rearrangement of the gene. Hardiman et al. (1997) demonstrated that the WNT10B gene encodes a 389- amino acid protein with 96.6% sequence identity to mouse Wnt10b. The expression pattern showed that it is synthesized in many adult tissues with the highest levels found in heart and skeletal muscle. Ross et al. (2000) showed that WNT signaling, likely mediated by WNT10B, is a molecular switch that governs adipogenesis. WNT signaling maintains preadipocytes in an undifferentiated state through inhibition of the adipogenic transcription factors CEBPA (OMIM Ref. No. 116897) and PPAR- gamma (OMIM Ref. No. 601487). When WNT signaling in preadipocytes is prevented by overexpression of

axin (OMIM Ref. No. 603816) or dominant- negative TCF4 (OMIM Ref. No. 602272), these cells differentiate into adipocytes. Disruption of WNT signaling also causes transdifferentiation of myoblasts into adipocytes in vitro, highlighting the importance of this pathway not only in adipocyte differentiation but also in mesodermal cell fate determination. By PCR typing of a human/rodent monochromosomal panel and FISH, Hardiman et al. (1997) mapped the WNT10B gene to chromosome 12q13.1. By analyzing human genome draft sequence, Kirikoshi et al. (2001) determined that WNT10B is encoded by 5 exons and is clustered with WNT1 (OMIM Ref. No. 164820) in a head- to- head manner with an interval of less than 7 kb. They hypothesized that the WNT1- WNT10B gene cluster and the WNT6 (OMIM Ref. No. 604663)- WNT10A (OMIM Ref. No. 606268) gene cluster on chromosome 2 might be due to duplication of an ancestral WNT gene cluster.

[13805]

[13806] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13807] Kirikoshi, H.; Sekihara, H.; Katoh, M. : WNT10A and WNT6, clustered in human chromosome 2q35 region with head-

to- tail manner, are strongly coexpressed in SW480 cells. Biochem. Biophys. Res. Commun. 283: 798- 805, 2001. ; and

[13808] Ross, S. E.; Hemati, N.; Longo, K. A.; Bennett, C. N.; Lucas, P. C.; Erickson, R. L.; MacDougald, O. A. : Inhibition of adipogenesis by Wnt signaling. Science 289: 950- 953, 2000.

[13809] Further studies establishing the function and utilities of WNT10B are found in John Hopkins OMIM database record ID 601906, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[13810] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 91 (GAM91), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13811] GAM91 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM91 was detected is described hereinabove with reference to Figs. 8-15.

[13812] GAM91 gene, herein designated GAM GENE, and GAM91 target gene, herein designated TARGET GENE, are human

genes contained in the human genome.

[13813] GAM91 gene encodes a GAM91 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM91 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM91 precursor RNA is designated SEQ ID:130, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:130 is located at position 50784242 relative to chromosome 1.

[13814] GAM91 precursor RNA folds onto itself, forming GAM91 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13815] GAM91 precursor RNA folds onto itself, forming GAM91 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[13816] Nucleotide sequence of GAM91 precursor RNA, designated SEQ-ID: 130, and a schematic representation of a predicted secondary folding of GAM91 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[13817] An enzyme complex designated DICER COMPLEX, `dices` the GAM91 folded precursor RNA into GAM91 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM91 RNA is designated SEQ ID:336, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[13818] GAM91 target gene, herein designated TARGET GENE, en-

codes a corresponding messenger RNA, GAM91 target RNA, herein designated GAM TARGET RNA. GAM91 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13819] GAM91 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM91 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM91 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM91 RNA may have a different number of target binding sites in untranslated regions of a GAM91 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13820] The complementary binding of GAM91 RNA, herein designated GAM RNA, to target binding sites on GAM91 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM91 target RNA into GAM91 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13821] It is appreciated that GAM91 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM91 target genes. The mRNA of each one of this plurality of GAM91 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM91 RNA, herein designated GAM RNA, and which when bound by GAM91 RNA causes inhibition of translation of respective one or more GAM91 target proteins.

[13822] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM91 gene, herein designated GAM GENE, on one or more GAM91 target genes, herein collectively designated

TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13823] It is appreciated that specific functions and accordingly utilities of GAM91 correlate with, and may be deduced from, the identity of the target genes which GAM91 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13824]

[13825]

[13826] Aquaporin 6, kidney specific (AQP6, Accession NM_053286.1) is a GAM91 target gene, herein designated TARGET GENE. AQP6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts

of mRNA encoded by AQP6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE, designated SEQ ID:14082, to the nucleotide sequence of GAM91 RNA, herein designated GAM RNA, also designated SEQ ID:336.

[13827] A function of GAM91 is therefore inhibition of Aquaporin 6, kidney specific (AQP6, Accession NM_053286.1), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid- base metabolism. Accordingly, utilities of GAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6.

[13828] The function of AQP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM51.1.Chromosome 20 open reading frame 70 (C20orf70, Accession XM_114180.1) is another GAM91 target gene, herein designated TARGET GENE. C20orf70 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf70, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf70 BINDING SITE, designated SEQ ID:17422, to the nucleotide sequence of GAM91 RNA, herein designated GAM RNA, also designated SEQ ID:336.

[13829] Another function of GAM91 is therefore inhibition of Chromosome 20 open reading frame 70 (C20orf70, Accession XM_114180.1) . Accordingly, utilities of GAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf70.

[13830] Fas (tnfrsf6) associated factor 1 (FAF1, Accession NM_131917.1) is another GAM91 target gene, herein designated TARGET GENE. FAF1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by FAF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FAF1 BINDING SITE, designated SEQ ID:899, to the nucleotide sequence of GAM91 RNA, herein designated GAM RNA, also designated SEQ ID:336.

[13831] Another function of GAM91 is therefore inhibition of Fas (tnfrsf6) associated factor 1 (FAF1, Accession

NM_131917.1) . Accordingly, utilities of GAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAF1.

[13832] FLJ20207 (Accession NM_017711.2) is another GAM91 target gene, herein designated TARGET GENE. FLJ20207 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20207, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20207 BINDING SITE, designated SEQ ID:3833, to the nucleotide sequence of GAM91 RNA, herein designated GAM RNA, also designated SEQ ID:336.

[13833] Another function of GAM91 is therefore inhibition of FLJ20207 (Accession NM_017711.2) . Accordingly, utilities of GAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20207.

[13834] FLJ22408 (Accession NM_024794.1) is another GAM91 target gene, herein designated TARGET GENE. FLJ22408 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22408, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ22408 BINDING SITE, designated SEQ ID:18346, to the nucleotide sequence of GAM91 RNA, herein designated GAM RNA, also designated SEQ ID:336.

[13835] Another function of GAM91 is therefore inhibition of FLJ22408 (Accession NM_024794.1) . Accordingly, utilities of GAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22408.

[13836] Hippocalcin-like 1 (HPCAL1, Accession NM_002149.2) is another GAM91 target gene, herein designated TARGET GENE. HPCAL1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HPCAL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HPCAL1 BINDING SITE, designated SEQ ID:4354, to the nucleotide sequence of GAM91 RNA, herein designated GAM RNA, also designated SEQ ID:336.

[13837] Another function of GAM91 is therefore inhibition of Hippocalcin-like 1 (HPCAL1, Accession NM_002149.2) . Accordingly, utilities of GAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with HPCAL1.

[13838] Lim domains containing 1 (LIMD1, Accession NM_014240.1) is another GAM91 target gene, herein designated TARGET GENE. LIMD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LIMD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LIMD1 BINDING SITE, designated SEQ ID:19473, to the nucleotide sequence of GAM91 RNA, herein designated GAM RNA, also designated SEQ ID:336.

[13839] Another function of GAM91 is therefore inhibition of Lim domains containing 1 (LIMD1, Accession NM_014240.1) . Accordingly, utilities of GAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMD1.

[13840]

[13841] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 92 (GAM92), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13842] GAM92 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM92 was detected is described hereinabove with reference to Figs. 8-15.

[13843] GAM92 gene, herein designated GAM GENE, and GAM92 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[13844] GAM92 gene encodes a GAM92 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM92 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM92 precursor RNA is designated SEQ ID:60, and is provided hereinbelow with reference to the sequence listing part.

[13845] GAM92 precursor RNA folds onto itself, forming GAM92 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide

sequence of the second half thereof.

[13846] GAM92 precursor RNA folds onto itself, forming GAM92 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[13847] Nucleotide sequence of GAM92 precursor RNA, designated SEQ-ID: 60, and a schematic representation of a predicted secondary folding of GAM92 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[13848] An enzyme complex designated DICER COMPLEX, `dices` the GAM92 folded precursor RNA into GAM92 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C)

nucleotide sequence of GAM92 RNA is designated SEQ ID:308, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[13849] GAM92 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM92 target RNA, herein designated GAM TARGET RNA. GAM92 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13850] GAM92 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM92 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM92 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limit-

ing GAM92 RNA may have a different number of target binding sites in untranslated regions of a GAM92 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13851] The complementary binding of GAM92 RNA, herein designated GAM RNA, to target binding sites on GAM92 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM92 target RNA into GAM92 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13852] It is appreciated that GAM92 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM92 target genes. The mRNA of each one of this plurality of GAM92 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM92 RNA, herein designated GAM RNA, and which when bound by GAM92 RNA causes inhibition of translation of respective one or more GAM92 target proteins.

[13853] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM92 gene, herein designated GAM GENE, on one or more GAM92 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13854] It is appreciated that specific functions and accordingly utilities of GAM92 correlate with, and may be deduced from, the identity of the target genes which GAM92 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13855]

[13856]

[13857] LOC158156 (Accession) is a GAM92 target gene, herein designated TARGET GENE. LOC158156 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158156, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158156 BINDING SITE, designated SEQ ID:16734, to the nucleotide sequence of GAM92 RNA, herein designated GAM RNA, also designated SEQ ID:308.

[13858] A function of GAM92 is therefore inhibition of LOC158156 (Accession) . Accordingly, utilities of GAM92 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158156.

[13859]

[13860] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 93 (GAM93), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13861] GAM93 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method

by which GAM93 was detected is described hereinabove with reference to Figs. 8-15.

[13862] GAM93 gene, herein designated GAM GENE, and GAM93 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[13863] GAM93 gene encodes a GAM93 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM93 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM93 precursor RNA is designated SEQ ID:14, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:14 is located at position 32921767 relative to chromosome 21.

[13864] GAM93 precursor RNA folds onto itself, forming GAM93 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13865] GAM93 precursor RNA folds onto itself, forming GAM93 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[13866] Nucleotide sequence of GAM93 precursor RNA, designated SEQ-ID: 14, and a schematic representation of a predicted secondary folding of GAM93 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[13867] An enzyme complex designated DICER COMPLEX, `dices` the GAM93 folded precursor RNA into GAM93 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM93 RNA is designated SEQ

ID:397, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[13868] GAM93 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM93 target RNA, herein designated GAM TARGET RNA. GAM93 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13869] GAM93 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM93 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM93 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM93 RNA may have a different number of target

binding sites in untranslated regions of a GAM93 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13870] The complementary binding of GAM93 RNA, herein designated GAM RNA, to target binding sites on GAM93 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM93 target RNA into GAM93 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13871] It is appreciated that GAM93 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM93 target genes. The mRNA of each one of this plurality of GAM93 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM93 RNA, herein designated GAM RNA, and which when bound by GAM93 RNA causes inhibition of translation of respective one or more GAM93 target proteins.

[13872] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM93 gene, herein designated GAM GENE, on one or more GAM93 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13873] It is appreciated that specific functions and accordingly utilities of GAM93 correlate with, and may be deduced from, the identity of the target genes which GAM93 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13874]

[13875]

[13876] FLJ32334 (Accession NM_144565.1) is a GAM93 target gene, herein designated TARGET GENE. FLJ32334 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32334, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32334 BINDING SITE, designated SEQ ID:19780, to the nucleotide sequence of GAM93 RNA, herein designated GAM RNA, also designated SEQ ID:397.

[13877] A function of GAM93 is therefore inhibition of FLJ32334 (Accession NM_144565.1) . Accordingly, utilities of GAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32334.

[13878] Plakophilin 2 (PKP2, Accession NM_004572.1) is another GAM93 target gene, herein designated TARGET GENE. PKP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PKP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PKP2 BINDING SITE, designated SEQ ID:7334, to the nucleotide sequence of GAM93 RNA, herein designated GAM

RNA, also designated SEQ ID:397.

[13879] Another function of GAM93 is therefore inhibition of Plakophilin 2 (PKP2, Accession NM_004572.1), a gene which may play a role in junctional plaques. Accordingly, utilities of GAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKP2.

[13880] The function of PKP2 has been established by previous studies. Plakophilins are armadillo repeat- containing proteins that are localized in the desmosomal plaque and cell nucleus. Desmosomal plakophilins, like plakophilin 2, form part of the link between the cytoplasmic tail of cadherins and the intermediate filament cytoskeleton (Bonne et al., 2000). Mertens et al. (1996) isolated cDNAs encoding 2 forms of plakophilin- 2 (PKP2), which they named PKP2a and PKP2b, from human colon carcinoma and heart cDNA libraries. The predicted 837- amino acid PKP2a protein contains 9 complete copies of the armadillo motif, which is an approximately 42- amino acid domain first defined in the Drosophila 'armadillo' gene product. Compared with PKP2a, the predicted 881- amino acid PKP2b protein contains an insertion of 44 amino acids between the second and third armadillo motifs. The authors sug-

gested that PKP2a and PKP2b are derived from alternatively spliced PKP2 transcripts. The PKP2 and PKP1 (OMIM Ref. No. 601975) proteins are 42% identical in the armadillo repeats. Immunoblot analysis of a wide range of human cell lines and tissues using antibodies against PKP2 detected an approximately 100- kD protein, which sometimes appeared as a twin band. Immunolocalization studies showed that PKP2 is a constituent of the desmosomal plaque in simple epithelia, some stratified epithelia, and some nonepithelial cells. PKP2 is also enriched in the karyoplasm of cells of various types, including those lacking desmosomes. Northern blot analysis detected approximately 5.3- kb PKP2 transcripts in diverse human cell lines and tissues representing both epithelial and nonepithelial cells. By fluorescence in situ hybridization and analysis of a somatic cell hybrid mapping panel, Bonne et al. (1998) mapped the PKP2 gene to 12p13. Schmidt et al. (1999) used FISH to map the PKP2 gene to 12p11. Further analysis by Bonne et al. (2000) of a human 12p13- specific PAC clone showed that 12p13 was the location of a processed plakophilin- 2 pseudogene, PKP2P1. By fluorescence in situ hybridization, Bonne et al. (2000) confirmed the localization of PKP2 to 12p11.

[13881]

[13882] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13883] Bonne, S.; van Hengel, J; van Roy, F. : Assignment of the plakophilin- 2 gene (PKP2) and a plakophilin- 2 pseudo-gene (PKP2P1) to human chromosome bands 12p11 and 12p13, respectively, by in situ hybridization. Cytogenet. Cell Genet. 88: 286- 287, 2000. ; and

[13884] Bonne, S.; van Hengel, J.; van Roy, F. : Chromosomal mapping of human armadillo genes belonging to the p120(ctn)/plakophilin subfamily. Genomics 51: 452- 454, 1998.

[13885] Further studies establishing the function and utilities of PKP2 are found in John Hopkins OMIM database record ID 602861, and in cited publications listed in Table 5, which are hereby incorporated by reference.Proline rich 1 (PROL1, Accession NM_021225.1) is another GAM93 target gene, herein designated TARGET GENE. PROL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PROL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of PROL1 BINDING SITE, designated SEQ ID:11105, to the nucleotide sequence of GAM93 RNA, herein designated GAM RNA, also designated SEQ ID:397.

[13886] Another function of GAM93 is therefore inhibition of Pro-line rich 1 (PROL1, Accession NM_021225.1) . Accordingly, utilities of GAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROL1.

[13887]

[13888] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, re-ferred to here as Genomic Address Messenger 94 (GAM94), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13889] GAM94 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM94 was detected is described hereinabove with reference to Figs. 8-15.

[13890] GAM94 gene, herein designated GAM GENE, and GAM94 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[13891] GAM94 gene encodes a GAM94 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM94 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM94 precursor RNA is designated SEQ ID:2, and is provided hereinbelow with reference to the sequence listing part.

[13892] GAM94 precursor RNA folds onto itself, forming GAM94 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13893] GAM94 precursor RNA folds onto itself, forming GAM94 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[13894] Nucleotide sequence of GAM94 precursor RNA, designated SEQ-ID: 2, and a schematic representation of a predicted secondary folding of GAM94 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[13895] An enzyme complex designated DICER COMPLEX, `dices` the GAM94 folded precursor RNA into GAM94 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM94 RNA is designated SEQ ID:332, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[13896] GAM94 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM94 target RNA, herein designated GAM TARGET RNA. GAM94 target

RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13897] GAM94 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM94 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM94 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM94 RNA may have a different number of target binding sites in untranslated regions of a GAM94 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13898] The complementary binding of GAM94 RNA, herein designated GAM RNA, to target binding sites on GAM94 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM94 target RNA into GAM94 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13899] It is appreciated that GAM94 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM94 target genes. The mRNA of each one of this plurality of GAM94 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM94 RNA, herein designated GAM RNA, and which when bound by GAM94 RNA causes inhibition of translation of respective one or more GAM94 target proteins.

[13900] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM94 gene, herein designated GAM GENE, on one or more GAM94 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the back-

ground section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13901] It is appreciated that specific functions and accordingly utilities of GAM94 correlate with, and may be deduced from, the identity of the target genes which GAM94 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13902]

[13903]

[13904] Atp-binding cassette, sub-family a (abc1), member 1 (ABCA1, Accession NP_005493.2) is a GAM94 target gene, herein designated TARGET GENE. ABCA1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ABCA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCA1 BINDING SITE, designated SEQ ID:8991, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13905] A function of GAM94 is therefore inhibition of Atp-binding cassette, sub-family a (abc1), member 1 (ABCA1, Accession NP_005493.2), a gene which camp- dependent and sulfonylurea- sensitive anion transporter. and therefore is associated with Tangier disease (high density lipoprotein deficiency type i). Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Tangier disease (high density lipoprotein deficiency type i), and of other diseases and clinical conditions associated with ABCA1.

[13906] The function of ABCA1 has been established by previous studies. By a PCR- based approach, Luciani et al. (1994) identified 2 novel mammalian members of the family of ATP- binding cassette (ABC) transporters designated ABC1 and ABC2 (OMIM Ref. No. 600047). They belong to a group of traffic ATPases encoded as a single multifunctional protein, such as CFTR (OMIM Ref. No. 602421) and P- glycoproteins (see OMIM Ref. No. 171050). Both ABC1

and ABC2 are large, internally symmetrical molecules that contain complete information for a functional 'channel-like' structure, a feature typical of the mammalian transporters at the plasma membrane. In both ABC1 and ABC2, the 2 halves of the molecules do not share extensive sequence similarity, apart from the nucleotide binding domains. This feature, shared with CFTR and with MRP1 (OMIM Ref. No. 158343), is in contrast with the high similarity shown by the 2 halves of P- glycoproteins. The finding argues against internal gene duplication as the event giving rise to the symmetric structure and favors the alternative hypothesis of the fusion of 2 independently evolved genes encoding the 2 halves. Santamarina- Fojo et al. (2000) found that the ABCA1 gene spans 149 kb and contains 50 exons. They identified 62 repetitive Alu sequences in the 49 introns. Comparative analysis of the mouse and human ABCA1 promoter sequences identified specific regulatory elements that are evolutionarily conserved. Pullinger et al. (2000) analyzed the promoter region of ABCA1. They identified 7 putative SP1 (OMIM Ref. No. 189906)- binding sites, 4 sterol regulatory elements (SREs) similar to the SRE of the low density lipoprotein receptor (LDLR; 606945) promoter region, a CpG island, a

possible weak TATA box, 2 distal CCAAT sequences, and binding sites for several other transcription factors.

[13907]

[13908] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13909] Luciani, M. F.; Denizot, F.; Savary, S.; Mattei, M. G.; Chimini, G. : Cloning of two novel ABC transporters mapping on human chromosome 9. Genomics 21: 150- 159, 1994. ; and

[13910] Santamarina- Fojo, S.; Peterson, K.; Knapper, C.; Qiu, Y.; Freeman, L.; Cheng, J.- F.; Osorio, J.; Remaley, A.; Yang, X.- P.; Haudenschild, C.; Prades, C.; Chimini, G.; Blackmon, E.; Franc.

[13911] Further studies establishing the function and utilities of ABCA1 are found in John Hopkins OMIM database record ID 600046, and in cited publications listed in Table 5, which are hereby incorporated by reference.Active bcr-related gene (ABR, Accession NP_001083.1) is another GAM94 target gene, herein designated TARGET GENE. ABR BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ABR, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABR BINDING SITE, designated SEQ ID:18596, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13912] Another function of GAM94 is therefore inhibition of Active bcr-related gene (ABR, Accession NP_001083.1), a gene which gtpase- activating protein for rac and cdc42. and therefore may be associated with Medulloblastoma. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Medulloblastoma, and of other diseases and clinical conditions associated with ABR.

[13913] The function of ABR has been established by previous studies. Heisterkamp et al. (1989) described an active BCR- related gene (ABR) that they identified based on its homology with the BCR gene (OMIM Ref. No. 151410) located on chromosome 22. BCR is involved in reciprocal translocations with the ABL oncogene (OMIM Ref. No. 189980) on chromosome 9 in Philadelphia chromosome-positive chronic myelogenous leukemia. Heisterkamp et al. (1993) mapped the ABR gene to 17p13.3 by in situ hybridization techniques. McDonald et al. (1994) found that the ABR locus was deleted in 7 of 8 informative cases of

medulloblastoma. Using pulsed field gel electrophoresis, they localized a polymorphic marker of the ABR gene to within 220 kb of D17S34. A cosmid contig constructed in this region was used to demonstrate by fluorescence in situ hybridization that the 5- prime to 3- prime transcriptional orientation of the ABR gene is toward the telomere.

[13914]

[13915] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13916] Heisterkamp, N.; Kaartinen, V.; van Soest, S.; Bokoch, G. M.; Groffen, J. : Human ABR encodes a protein with GAP-rac activity and homology to the DBL nucleotide exchange factor domain. J. Biol. Chem. 268: 16903- 16906, 1993. ; and

[13917] McDonald, J. D.; Daneshvar, L.; Willert, J. R.; Matsumura, K.; Waldman, F.; Cogen, P. H. : Physical mapping of chromosome 17p13.3 in the region of a putative tumor suppressor gene import.

[13918] Further studies establishing the function and utilities of ABR are found in John Hopkins OMIM database record ID 600365, and in cited publications listed in Table 5, which are hereby incorporated by reference.Angiotensin i con-

verting enzyme (peptidyl-dipeptidase a) 1 (ACE, Accession NP_690044.1) is another GAM94 target gene, herein designated TARGET GENE. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACE BINDING SITE, designated SEQ ID:10322, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13919] Another function of GAM94 is therefore inhibition of Angiotensin i converting enzyme (peptidyl-dipeptidase a) 1 (ACE, Accession NP_690044.1), a gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACE.

[13920] The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.ACTR6 (Accession NP_071941.1) is another GAM94 target gene, herein designated TARGET GENE.

ACTR6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ACTR6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACTR6 BINDING SITE, designated SEQ ID:17448, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13921] Another function of GAM94 is therefore inhibition of ACTR6 (Accession NP_071941.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTR6.

[13922] Arp8 actin-related protein 8 homolog (yeast) (ACTR8, Accession NP_075050.1) is another GAM94 target gene, herein designated TARGET GENE. ACTR8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACTR8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACTR8 BINDING SITE, designated SEQ ID:7335, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13923] Another function of GAM94 is therefore inhibition of Arp8 actin-related protein 8 homolog (yeast) (ACTR8, Accession NP_075050.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTR8.

[13924] A disintegrin and metalloproteinase domain 10 (ADAM10, Accession NP_001101.1) is another GAM94 target gene, herein designated TARGET GENE. ADAM10 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ADAM10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAM10 BINDING SITE, designated SEQ ID:19754, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13925] Another function of GAM94 is therefore inhibition of A disintegrin and metalloproteinase domain 10 (ADAM10, Accession NP_001101.1), a gene which Member of ADAM family of zinc metalloproteases. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM10.

[13926] The function of ADAM10 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 8 (ADAMTS8, Accession NP_008968.2) is another GAM94 target gene, herein designated TARGET GENE. ADAMTS8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAMTS8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAMTS8 BINDING SITE, designated SEQ ID:19214, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13927] Another function of GAM94 is therefore inhibition of A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 8 (ADAMTS8, Accession NP_008968.2), a gene which has anti- angiogenic properties. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS8.

[13928] The function of ADAMTS8 has been established by previous studies. Thrombospondin- 1 (THBS1; 188060) asso-

ciates with the extracellular matrix and inhibits angiogenesis in vivo. In vitro, THBS1 blocks capillary- like tube formation and endothelial cell proliferation. The antiangiogenic activity is mediated by a region that contains 3 type 1 (properdin or thrombospondin) repeats. By searching an EST database for sequences containing the antiangiogenic motif of THBS1, Vazquez et al. (1999) identified heart and lung cDNAs encoding ADAMTS1 (OMIM Ref. No. 605174) and ADAMTS8, which they called METH1 and METH2, respectively. Sequence analysis predicted that the 890- amino acid ADAMTS8 protein shares 52% amino acid identity with ADAMTS1. ADAMTS8 is a secreted protein that has an N- terminal signal peptide, a zinc metalloprotease domain containing a zinc- binding site, and a cysteine- rich region containing 2 putative disintegrin loops. The C terminus of ADAMTS8 has 2 heparin- binding thrombospondin repeats with 6 cys and 3 trp residues. Southern blot analysis showed that ADAMTS8 is a single-copy gene distinct from that encoding ADAMTS1. Northern blot analysis detected highest expression of a 3.7- kb ADAMTS8 transcript in adult and fetal lung, with lower expression in brain, placenta, heart, and stomach, as well as fetal brain and kidney. Expression was also detected in

a colon carcinoma cell line. SDS- PAGE analysis demonstrated that ADAMTS8 is expressed as a 98- kD protein, a 79- kD protein after cleavage at the subtilisin site, or as a 64- kD protein, which is most abundant, generated by an additional processing event. Functional analysis determined that ADAMTS8 disrupts angiogenesis in vivo and in vitro more efficiently than THBS1 or endostatin (OMIM Ref. No. 120328) but somewhat less efficiently than ADAMTS1. By interspecific backcross analysis, Georgiadis et al. (1999) mapped the mouse Adamts8 gene to chromosome 9 in a region showing homology of synteny with human 11q23- qter. They mapped the human ADAMTS8 gene to 11q25 by PCR analysis of a radiation hybrid mapping panel. The authors noted that a number of disorders have been mapped in the vicinity of the ADAMTS8 gene in mice and humans, most notably, given the expression and functional analyses, lung neoplasms.

[13929]

[13930] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13931] Georgiadis, K. E.; Hirohata, S.; Seldin, M. F.; Apte, S. S. : ADAM- TS8, a novel metalloprotease of the ADAM- TS

family located on mouse chromosome 9 and human chromosome 11. Genomics 62: 312- 315, 1999. ; and

[13932] Vazquez, F.; Hastings, G.; Ortega, M.- A.; Lane, T. F.; Oikemus, S.; Lombardo, M.; Iruela- Arispe, M. L. : METH-1, a human ortholog of ADAMTS- 1, and METH- 2 are members of a new family of.

[13933] Further studies establishing the function and utilities of ADAMTS8 are found in John Hopkins OMIM database record ID 605175, and in cited publications listed in Table 5, which are hereby incorporated by reference.Afg3 atpase family gene 3-like 1 (yeast) (AFG3L1, Accession NP_001123.1) is another GAM94 target gene, herein designated TARGET GENE. AFG3L1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AFG3L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AFG3L1 BINDING SITE, designated SEQ ID:13711, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13934] Another function of GAM94 is therefore inhibition of Afg3 atpase family gene 3-like 1 (yeast) (AFG3L1, Accession

NP_001123.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AFG3L1.

[13935] A kinase (prka) anchor protein 2 (AKAP2, Accession NP_009134.1) is another GAM94 target gene, herein designated TARGET GENE. AKAP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AKAP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AKAP2 BINDING SITE, designated SEQ ID:6726, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13936] Another function of GAM94 is therefore inhibition of A kinase (prka) anchor protein 2 (AKAP2, Accession NP_009134.1), a gene which binds to regulatory subunit (rii) of protein kinase a. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP2.

[13937] The function of AKAP2 has been established by previous studies. Gene map locus Chr.9 Protein kinase A (PKA; OMIM Ref. No. 176911) mediates actions of hormones and

neurotransmitters that activate adenylate cyclase (see OMIM Ref. No. 103070). Signals carried by cAMP are often directed at discrete intracellular sites. A nonuniform distribution of PKA type II molecules occurs when they are attached to the cytoskeleton by 'A- kinase anchor proteins' (see OMIM Ref. No. AKAP1, 602449). Such anchored molecules may be essential for dissemination of cAMP signals in highly polarized epithelium such as lung and kidney. Using yeast 2- hybrid screening, Dong et al. (1998) isolated cDNAs encoding 6 isoforms of a full-length 885- kD mouse protein which they termed AKAP-KL because of its expression in epithelial cells of kidney and lung. Sequence analysis showed that the isoforms are generated by alternative splicing and by utilization of either of 2 translation start codons. Using affinity chromatography and Western blot analysis, the authors showed that AKAP- KL binds PKA type II in intact cells. By immunoblot analysis of tissue fractions, Dong et al. (1998) found that AKAP- KL is abundantly expressed in lung, moderately expressed in thymus and cerebellum, but absent in heart, cerebral cortex, and liver. Confocal immunofluorescence microscopy revealed that AKAP- KL accumulates in regions of the cortical cytoskeleton in as-

sociation with F- actin (see OMIM Ref. No. 102610) in human embryonic kidney cells. By radiation hybrid analysis, Nagase et al. (1999) mapped the human AKAP gene, which they called KIAA0920, to chromosome 9.

[13938]

[13939] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13940] Dong, F.; Feldmesser, M.; Casadevall, A.; Rubin, C. S. : Molecular characterization of a cDNA that encodes six isoforms of a novel murine A kinase anchor protein. J. Biol. Chem. 273: 6533- 6541, 1998. ; and

[13942] Further studies establishing the function and utilities of AKAP2 are found in John Hopkins OMIM database record ID 604582, and in cited publications listed in Table 5, which are hereby incorporated by reference.A kinase (prka) anchor protein 2 (AKAP2, Accession NP_671492.1) is another GAM94 target gene, herein designated TARGET GENE. AKAP2 BINDING SITE is a target binding site found

in the 3` untranslated region of multiple transcripts of mRNA encoded by AKAP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AKAP2 BINDING SITE, designated SEQ ID:6726, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13943] Another function of GAM94 is therefore inhibition of A kinase (prka) anchor protein 2 (AKAP2, Accession NP_671492.1), a gene which binds to regulatory subunit (rii) of protein kinase a. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP2.

[13944] The function of AKAP2 has been established by previous studies. Gene map locus Chr.9 Protein kinase A (PKA; OMIM Ref. No. 176911) mediates actions of hormones and neurotransmitters that activate adenylate cyclase (see OMIM Ref. No. 103070). Signals carried by cAMP are often directed at discrete intracellular sites. A nonuniform distribution of PKA type II molecules occurs when they are attached to the cytoskeleton by 'A- kinase anchor proteins' (see OMIM Ref. No. AKAP1, 602449). Such anchored

molecules may be essential for dissemination of cAMP signals in highly polarized epithelium such as lung and kidney. Using yeast 2- hybrid screening, Dong et al. (1998) isolated cDNAs encoding 6 isoforms of a full-length 885- kD mouse protein which they termed AKAP-KL because of its expression in epithelial cells of kidney and lung. Sequence analysis showed that the isoforms are generated by alternative splicing and by utilization of either of 2 translation start codons. Using affinity chromatography and Western blot analysis, the authors showed that AKAP- KL binds PKA type II in intact cells. By immunoblot analysis of tissue fractions, Dong et al. (1998) found that AKAP- KL is abundantly expressed in lung, moderately expressed in thymus and cerebellum, but absent in heart, cerebral cortex, and liver. Confocal immunofluorescence microscopy revealed that AKAP- KL accumulates in regions of the cortical cytoskeleton in association with F- actin (see OMIM Ref. No. 102610) in human embryonic kidney cells. By radiation hybrid analysis, Nagase et al. (1999) mapped the human AKAP gene, which they called KIAA0920, to chromosome 9.

[13945]

[13946] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[13947] Dong, F.; Feldmesser, M.; Casadevall, A.; Rubin, C. S. : Molecular characterization of a cDNA that encodes six isoforms of a novel murine A kinase anchor protein. J. Biol. Chem. 273: 6533- 6541, 1998. ; and

[13948] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hirosawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human ge.

[13949] Further studies establishing the function and utilities of AKAP2 are found in John Hopkins OMIM database record ID 604582, and in cited publications listed in Table 5, which are hereby incorporated by reference.ALEX3 (Accession NP_057691.1) is another GAM94 target gene, herein designated TARGET GENE. ALEX3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ALEX3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALEX3 BINDING SITE, designated SEQ ID:15945, to the nucleotide sequence of GAM94 RNA, herein designated GAM

RNA, also designated SEQ ID:332.

[13950] Another function of GAM94 is therefore inhibition of ALEX3 (Accession NP_057691.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALEX3.

[13951] ALEX3 (Accession NP_808816.1) is another GAM94 target gene, herein designated TARGET GENE. ALEX3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ALEX3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALEX3 BINDING SITE, designated SEQ ID:15945, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13952] Another function of GAM94 is therefore inhibition of ALEX3 (Accession NP_808816.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALEX3.

[13953] ALEX3 (Accession NP_808817.1) is another GAM94 target gene, herein designated TARGET GENE. ALEX3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ALEX3,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALEX3 BINDING SITE, designated SEQ ID:15945, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13954] Another function of GAM94 is therefore inhibition of ALEX3 (Accession NP_808817.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALEX3.

[13955] ALK7 (Accession NP_660302.1) is another GAM94 target gene, herein designated TARGET GENE. ALK7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALK7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALK7 BINDING SITE, designated SEQ ID:1036, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13956] Another function of GAM94 is therefore inhibition of ALK7 (Accession NP_660302.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with ALK7.

[13957] Ankyrin 1, erythrocytic (ANK1, Accession NP_065208.1) is another GAM94 target gene, herein designated TARGET GENE. ANK1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ANK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:1839, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13958] Another function of GAM94 is therefore inhibition of Ankyrin 1, erythrocytic (ANK1, Accession NP_065208.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1.

[13959] Ankyrin 1, erythrocytic (ANK1, Accession NP_065214.1) is another GAM94 target gene, herein designated TARGET GENE. ANK1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ANK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:1839, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13960] Another function of GAM94 is therefore inhibition of Ankyrin 1, erythrocytic (ANK1, Accession NP_065214.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1.

[13961] Ankyrin 1, erythrocytic (ANK1, Accession NP_065210.1) is another GAM94 target gene, herein designated TARGET GENE. ANK1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ANK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:1839, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13962] Another function of GAM94 is therefore inhibition of Ankyrin 1, erythrocytic (ANK1, Accession NP_065210.1) .

Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1.

[13963] Ankyrin 1, erythrocytic (ANK1, Accession NP_065211.1) is another GAM94 target gene, herein designated TARGET GENE. ANK1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ANK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:1839, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13964] Another function of GAM94 is therefore inhibition of Ankyrin 1, erythrocytic (ANK1, Accession NP_065211.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1.

[13965] Ankyrin 1, erythrocytic (ANK1, Accession NP_000028.2) is another GAM94 target gene, herein designated TARGET GENE. ANK1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of

mRNA encoded by ANK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:1839, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13966] Another function of GAM94 is therefore inhibition of Ankyrin 1, erythrocytic (ANK1, Accession NP_000028.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1.

[13967] Ankyrin 1, erythrocytic (ANK1, Accession NP_065213.1) is another GAM94 target gene, herein designated TARGET GENE. ANK1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ANK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:1839, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13968] Another function of GAM94 is therefore inhibition of Ankyrin 1, erythrocytic (ANK1, Accession NP_065213.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1.

[13969] Ankyrin 1, erythrocytic (ANK1, Accession NP_065212.1) is another GAM94 target gene, herein designated TARGET GENE. ANK1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ANK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:1839, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13970] Another function of GAM94 is therefore inhibition of Ankyrin 1, erythrocytic (ANK1, Accession NP_065212.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1.

[13971] Ankyrin 1, erythrocytic (ANK1, Accession NP_065209.1) is another GAM94 target gene, herein designated TARGET

GENE. ANK1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ANK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:1839, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13972] Another function of GAM94 is therefore inhibition of Ankyrin 1, erythrocytic (ANK1, Accession NP_065209.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1.

[13973] AP1S3 (Accession XP_291023.1) is another GAM94 target gene, herein designated TARGET GENE. AP1S3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by AP1S3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1S3 BINDING SITE, designated SEQ ID:6748, to the nucleotide sequence of GAM94 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:332.

[13974] Another function of GAM94 is therefore inhibition of AP1S3 (Accession XP_291023.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1S3.

[13975] APLN (Accession NP_059109.2) is another GAM94 target gene, herein designated TARGET GENE. APLN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APLN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APLN BINDING SITE, designated SEQ ID:3649, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13976] Another function of GAM94 is therefore inhibition of APLN (Accession NP_059109.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APLN.

[13977] Apolipoprotein a-v (APOA5, Accession NP_443200.1) is another GAM94 target gene, herein designated TARGET GENE. APOA5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by

APOA5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOA5 BINDING SITE, designated SEQ ID:14854, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13978] Another function of GAM94 is therefore inhibition of Apolipoprotein a-v (APOA5, Accession NP_443200.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOA5.

[13979] Aquaporin 1 (channel-forming integral protein, 28kda) (AQP1, Accession NP_000376.1) is another GAM94 target gene, herein designated TARGET GENE. AQP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AQP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AQP1 BINDING SITE, designated SEQ ID:19824, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13980] Another function of GAM94 is therefore inhibition of

Aquaporin 1 (channel-forming integral protein, 28kda) (AQP1, Accession NP_000376.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP1.

[13981] Archain 1 (ARCN1, Accession NP_001646.2) is another GAM94 target gene, herein designated TARGET GENE. ARCN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARCN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARCN1 BINDING SITE, designated SEQ ID:10942, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13982] Another function of GAM94 is therefore inhibition of Archain 1 (ARCN1, Accession NP_001646.2), a gene which plays a fundamental role in eukaryotic cell biology. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARCN1.

[13983] The function of ARCN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM30.1.Rho guanine nucleotide exchange factor (gef) 12 (ARHGEF12, Accession NP_056128.1) is another GAM94 target gene, herein designated TARGET GENE. ARHGEF12 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHGEF12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGEF12 BINDING SITE, designated SEQ ID:3599, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13984] Another function of GAM94 is therefore inhibition of Rho guanine nucleotide exchange factor (gef) 12 (ARHGEF12, Accession NP_056128.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF12.

[13985] Cdc42 guanine nucleotide exchange factor (gef) 9 (ARHGEF9, Accession NP_056000.1) is another GAM94 target gene, herein designated TARGET GENE. ARHGEF9 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ARHGEF9, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGEF9 BINDING SITE, designated SEQ ID:14362, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13986] Another function of GAM94 is therefore inhibition of Cdc42 guanine nucleotide exchange factor (gef) 9 (ARHGEF9, Accession NP_056000.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF9.

[13987] Astrotactin (ASTN, Accession XP_045113.1) is another GAM94 target gene, herein designated TARGET GENE. ASTN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ASTN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASTN BINDING SITE, designated SEQ ID:14476, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13988] Another function of GAM94 is therefore inhibition of Astrotactin (ASTN, Accession XP_045113.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with ASTN.

[13989] Atpase, h+ transporting, lysosomal 13kda, v1 subunit g isoform 2 (ATP6V1G2, Accession NP_569730.1) is another GAM94 target gene, herein designated TARGET GENE. ATP6V1G2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ATP6V1G2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP6V1G2 BINDING SITE, designated SEQ ID:2763, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13990] Another function of GAM94 is therefore inhibition of Atpase, h+ transporting, lysosomal 13kda, v1 subunit g isoform 2 (ATP6V1G2, Accession NP_569730.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1G2.

[13991] Beta-site app-cleaving enzyme (BACE, Accession NP_620428.1) is another GAM94 target gene, herein designated TARGET GENE. BACE BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE, designated SEQ ID:19344, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13992] Another function of GAM94 is therefore inhibition of Beta-site app-cleaving enzyme (BACE, Accession NP_620428.1), a gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore may be associated with Alzheimer disease. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Alzheimer disease, and of other diseases and clinical conditions associated with BACE.

[13993] The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM71.1.Beta-site app-cleaving enzyme (BACE, Accession NP_036236.1) is another GAM94 target gene, herein designated TARGET GENE. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE, designated SEQ ID:19344, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13994] Another function of GAM94 is therefore inhibition of Beta-site app-cleaving enzyme (BACE, Accession NP_036236.1), a gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore may be associated with Alzheimer disease. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Alzheimer disease, and of other diseases and clinical conditions associated with BACE.

[13995] The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM71.1.Beta-site app-cleaving enzyme (BACE, Accession NP_620429.1) is another GAM94 target gene, herein designated TARGET GENE. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE, designated SEQ ID:19344, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13996] Another function of GAM94 is therefore inhibition of Beta-site app-cleaving enzyme (BACE, Accession NP_620429.1), a gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore may be associated with Alzheimer disease. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Alzheimer disease, and of other diseases and clinical conditions associated with BACE.

[13997] The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM71.1.Beta-site app-cleaving enzyme (BACE, Accession NP_620427.1) is another GAM94 target gene, herein designated TARGET GENE. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE, designated SEQ ID:19344, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[13998] Another function of GAM94 is therefore inhibition of Beta-site app-cleaving enzyme (BACE, Accession NP_620427.1), a gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore may be associated with Alzheimer disease. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Alzheimer disease, and of other diseases and clinical conditions associated with BACE.

[13999] The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM71.1.Btb and cnc homology 1, basic leucine zipper transcription factor 2 (BACH2, Accession NP_068585.1) is another GAM94 target gene, herein designated TARGET GENE. BACH2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BACH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACH2 BINDING SITE, designated SEQ ID:17333, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14000] Another function of GAM94 is therefore inhibition of Btb and cnc homology 1, basic leucine zipper transcription factor 2 (BACH2, Accession NP_068585.1), a gene which acts as repressor or activator, binds to maf recognition elements and therefore may be associated with Non-hodgkin lymphoma. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Non-hodgkin lymphoma, and of other diseases and clinical conditions associated with BACH2.

[14001] The function of BACH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Bromodomain adjacent to zinc finger domain, 2a (BAZ2A, Accession NP_038477.1) is another GAM94 target gene, herein designated TARGET GENE. BAZ2A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BAZ2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of BAZ2A BINDING SITE, designated SEQ ID:16323, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14002] Another function of GAM94 is therefore inhibition of Bromodomain adjacent to zinc finger domain, 2a (BAZ2A, Accession NP_038477.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ2A.

[14003] B-cell cll/lymphoma 11b (zinc finger protein) (BCL11B, Accession NP_075049.1) is another GAM94 target gene, herein designated TARGET GENE. BCL11B BINDING SITE1 and BCL11B BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BCL11B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE1 and BCL11B BINDING SITE2, designated SEQ ID:17597 and SEQ ID:17597 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14004] Another function of GAM94 is therefore inhibition of B-

cell cll/lymphoma 11b (zinc finger protein) (BCL11B, Accession NP_075049.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B.

[14005] B-cell cll/lymphoma 11b (zinc finger protein) (BCL11B, Accession NP_075049.1) is another GAM94 target gene, herein designated TARGET GENE. BCL11B BINDING SITE1 and BCL11B BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BCL11B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE1 and BCL11B BINDING SITE2, designated SEQ ID:3630 and SEQ ID:14045 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14006] Another function of GAM94 is therefore inhibition of B-cell cll/lymphoma 11b (zinc finger protein) (BCL11B, Accession NP_075049.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B.

[14007] BM-002 (Accession NP_057701.1) is another GAM94 tar-

get gene, herein designated TARGET GENE. BM-002 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BM-002, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BM-002 BINDING SITE, designated SEQ ID:19641, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14008] Another function of GAM94 is therefore inhibition of BM-002 (Accession NP_057701.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BM-002.

[14009] Bone morphogenetic protein 4 (BMP4, Accession NP_570911.1) is another GAM94 target gene, herein designated TARGET GENE. BMP4 BINDING SITE1 through BMP4 BINDING SITE4 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BMP4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BMP4 BINDING SITE1 through BMP4 BINDING SITE4, designated SEQ ID:17767, SEQ ID:11479,

SEQ ID:16063 and SEQ ID:17767 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14010] Another function of GAM94 is therefore inhibition of Bone morphogenetic protein 4 (BMP4, Accession NP_570911.1), a gene which acts in mesoderm induction, tooth development, limb formation and fracture repair and therefore may be associated with Fibrodysplasia ossificans progressiva. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Fibrodysplasia ossificans progressiva, and of other diseases and clinical conditions associated with BMP4.

[14011] The function of BMP4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Bone morphogenetic protein 4 (BMP4, Accession NP_570911.1) is another GAM94 target gene, herein designated TARGET GENE. BMP4 BINDING SITE1 through BMP4 BINDING SITE4 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BMP4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of BMP4 BINDING SITE1 through BMP4 BINDING SITE4, designated SEQ ID:11479, SEQ ID:15443, SEQ ID:15443 and SEQ ID:16063 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14012] Another function of GAM94 is therefore inhibition of Bone morphogenetic protein 4 (BMP4, Accession NP_570911.1), a gene which acts in mesoderm induction, tooth development, limb formation and fracture repair and therefore may be associated with Fibrodysplasia ossificans progressiva. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Fibrodysplasia ossificans progressiva, and of other diseases and clinical conditions associated with BMP4.

[14013] The function of BMP4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Basic transcription element binding protein 1 (BTEB1, Accession NP_001197.1) is another GAM94 target gene, herein designated TARGET GENE. BTEB1 BINDING SITE1 and BTEB1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by BTEB1, corresponding to target binding sites such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BTEB1 BINDING SITE1 and BTEB1 BINDING SITE2, designated SEQ ID:6904 and SEQ ID:12461 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14014] Another function of GAM94 is therefore inhibition of Basic transcription element binding protein 1 (BTEB1, Accession NP_001197.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTEB1.

[14015] Butyrophilin, subfamily 2, member a1 (BTN2A1, Accession NP_008980.1) is another GAM94 target gene, herein designated TARGET GENE. BTN2A1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BTN2A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BTN2A1 BINDING SITE, designated SEQ ID:2586, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14016] Another function of GAM94 is therefore inhibition of Buty-

rophilin, subfamily 2, member a1 (BTN2A1, Accession NP_008980.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN2A1.

[14017] Butyrophilin, subfamily 2, member a1 (BTN2A1, Accession NP_510961.1) is another GAM94 target gene, herein designated TARGET GENE. BTN2A1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BTN2A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BTN2A1 BINDING SITE, designated SEQ ID:2586, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14018] Another function of GAM94 is therefore inhibition of Butyrophilin, subfamily 2, member a1 (BTN2A1, Accession NP_510961.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN2A1.

[14019] BY55 (Accession NP_008984.1) is another GAM94 target gene, herein designated TARGET GENE. BY55 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by BY55, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BY55 BINDING SITE, designated SEQ ID:11183, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14020] Another function of GAM94 is therefore inhibition of BY55 (Accession NP_008984.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BY55.

[14021] C10orf5 (Accession XP_172843.1) is another GAM94 target gene, herein designated TARGET GENE. C10orf5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C10orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C10orf5 BINDING SITE, designated SEQ ID:12775, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14022] Another function of GAM94 is therefore inhibition of C10orf5 (Accession XP_172843.1) . Accordingly, utilities

of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C10orf5.

[14023] C14orf72 (Accession XP_096733.1) is another GAM94 target gene, herein designated TARGET GENE. C14orf72 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C14orf72, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf72 BINDING SITE, designated SEQ ID:7433, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14024] Another function of GAM94 is therefore inhibition of C14orf72 (Accession XP_096733.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf72.

[14025] Chromosome 1 open reading frame 16 (C1orf16, Accession NP_055652.2) is another GAM94 target gene, herein designated TARGET GENE. C1orf16 BINDING SITE1 and C1orf16 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by C1orf16, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of C1orf16 BINDING SITE1 and C1orf16 BINDING SITE2, designated SEQ ID:7627 and SEQ ID:4187 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14026] Another function of GAM94 is therefore inhibition of Chromosome 1 open reading frame 16 (C1orf16, Accession NP_055652.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf16.

[14027] Chromosome 1 open reading frame 2 (C1orf2, Accession NP_006580.1) is another GAM94 target gene, herein designated TARGET GENE. C1orf2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1orf2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf2 BINDING SITE, designated SEQ ID:1834, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14028] Another function of GAM94 is therefore inhibition of Chromosome 1 open reading frame 2 (C1orf2, Accession NP_006580.1) . Accordingly, utilities of GAM94 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf2.

[14029] Chromosome 1 open reading frame 21 (C1orf21, Accession NP_110433.1) is another GAM94 target gene, herein designated TARGET GENE. C1orf21 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1orf21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf21 BINDING SITE, designated SEQ ID:15376, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14030] Another function of GAM94 is therefore inhibition of Chromosome 1 open reading frame 21 (C1orf21, Accession NP_110433.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf21.

[14031] Chromosome 1 open reading frame 9 (C1orf9, Accession NP_055098.1) is another GAM94 target gene, herein designated TARGET GENE. C1orf9 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by C1orf9, correspond-

ing to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf9 BINDING SITE, designated SEQ ID:19770, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14032] Another function of GAM94 is therefore inhibition of Chromosome 1 open reading frame 9 (C1orf9, Accession NP_055098.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf9.

[14033] Chromosome 20 open reading frame 158 (C20orf158, Accession NP_689515.1) is another GAM94 target gene, herein designated TARGET GENE. C20orf158 BINDING SITE1 and C20orf158 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by C20orf158, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf158 BINDING SITE1 and C20orf158 BINDING SITE2, designated SEQ ID:14515 and SEQ ID:14428 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated

SEQ ID:332.

[14034] Another function of GAM94 is therefore inhibition of Chromosome 20 open reading frame 158 (C20orf158, Accession NP_689515.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf158.

[14035] Chromosome 20 open reading frame 174 (C20orf174, Accession XP_066058.2) is another GAM94 target gene, herein designated TARGET GENE. C20orf174 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf174, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf174 BINDING SITE, designated SEQ ID:14077, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14036] Another function of GAM94 is therefore inhibition of Chromosome 20 open reading frame 174 (C20orf174, Accession XP_066058.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf174.

[14037] Chromosome 3 open reading frame 4 (C3orf4, Accession

NP_063948.1) is another GAM94 target gene, herein designated TARGET GENE. C3orf4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C3orf4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C3orf4 BINDING SITE, designated SEQ ID:12175, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14038] Another function of GAM94 is therefore inhibition of Chromosome 3 open reading frame 4 (C3orf4, Accession NP_063948.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3orf4.

[14039] Chromosome 5 open reading frame 4 (C5orf4, Accession NP_115761.1) is another GAM94 target gene, herein designated TARGET GENE. C5orf4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C5orf4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE, designated SEQ ID:1351, to the nu-

cleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14040] Another function of GAM94 is therefore inhibition of Chromosome 5 open reading frame 4 (C5orf4, Accession NP_115761.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4.

[14041] Chromosome 5 open reading frame 4 (C5orf4, Accession NP_057432.1) is another GAM94 target gene, herein designated TARGET GENE. C5orf4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C5orf4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE, designated SEQ ID:1351, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14042] Another function of GAM94 is therefore inhibition of Chromosome 5 open reading frame 4 (C5orf4, Accession NP_057432.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4.

[14043] C6orf49 (Accession NP_060071.1) is another GAM94 target gene, herein designated TARGET GENE. C6orf49 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by C6orf49, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf49 BINDING SITE, designated SEQ ID:5100, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14044] Another function of GAM94 is therefore inhibition of C6orf49 (Accession NP_060071.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf49.

[14045] C6orf84 (Accession NP_055710.1) is another GAM94 target gene, herein designated TARGET GENE. C6orf84 BINDING SITE1 and C6orf84 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by C6orf84, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf84 BINDING SITE1 and C6orf84 BINDING SITE2, designated SEQ ID:5543 and SEQ

ID:16947 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14046] Another function of GAM94 is therefore inhibition of C6orf84 (Accession NP_055710.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf84.

[14047] Chromosome 8 open reading frame 17 (C8orf17, Accession NP_064622.1) is another GAM94 target gene, herein designated TARGET GENE. C8orf17 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C8orf17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C8orf17 BINDING SITE, designated SEQ ID:4088, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14048] Another function of GAM94 is therefore inhibition of Chromosome 8 open reading frame 17 (C8orf17, Accession NP_064622.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf17.

[14049] Carbonic anhydrase x (CA10, Accession NP_064563.1) is another GAM94 target gene, herein designated TARGET GENE. CA10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CA10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CA10 BINDING SITE, designated SEQ ID:3311, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14050] Another function of GAM94 is therefore inhibition of Carbonic anhydrase x (CA10, Accession NP_064563.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA10.

[14051] Calcitonin receptor (CALCR, Accession NP_001733.1) is another GAM94 target gene, herein designated TARGET GENE. CALCR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CALCR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CALCR BINDING SITE, designated

SEQ ID:16744, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14052] Another function of GAM94 is therefore inhibition of Calcitonin receptor (CALCR, Accession NP_001733.1), a gene which is a receptor for calcitonin, is mediated by g proteins which activate adenylyl cyclase, and thought to couple to the heterotrimeric guanosine triphosphate- binding protein that is sensitive to cholera toxin. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALCR.

[14053] The function of CALCR has been established by previous studies. Taboulet et al. (1996) had reported the point mutation polymorphism (OMIM Ref. No. T to C) in the 3-prime region of the CALCR gene which induced a pro447-to- leu amino acid change in the third intracellular domain of the protein. This was the same mutation as that subsequently identified by Nakamura et al. (1997) and Masi et al. (1998) and referred to as pro463 to leu; the difference in numbering depended on whether isoform 1 or isoform 2 of the calcitonin receptor, with or without the 16- amino acid insert, was referred to (de Vernejoul, 1999). Taboulet et al. (1998) studied the distribution of

these alleles in a cohort of 123 women with no osteoporotic fractures and 92 women who presented with one or more osteoporotic fractures of wrist or vertebrae. They found that bone mineral density of the femoral neck was significantly higher in heterozygous subjects compared with the homozygous leucine and homozygous proline genotypes. Also, a decreased fracture risk was observed in heterozygote subjects. In conclusion, they suggested that polymorphism of CALCR is associated with osteoporotic factors and bone mineral density in a population of postmenopausal women. The heterozygous advantage of the pro/leu subjects could explain their protection against osteoporosis. The distribution of the CALCR alleles in the French population studied by Taboulet et al. (1998) was quite different from that observed by Nakamura et al. (1997) in the Japanese population. In Japan, the proline homozygote was the most frequent genotype (70%), Gorn et al. (1992) cloned a human calcitonin receptor cDNA from a eukaryotic expression library prepared from an ovarian small cell carcinoma cell line. A cell line had been shown to respond to calcitonin (CT, or CALCA; 114130) with increases in content of cellular cAMP. Transfection of this cDNA into COS cells resulted in expression of recep-

tors with high affinity for salmon and human calcitonin. The expressed CALCR was coupled to adenylate cyclase. Northern analysis indicated a single transcript of about 4.2 kb. The cloned cDNA encoded a putative peptide of 490 amino acids with 7 potential transmembrane domains. The amino acid sequence was 73% identical to porcine CALCR, although the human CALCR contained an inset of 16 amino acids between transmembrane domains I and II. CALCR is closely related to the parathyroid hormone receptor (OMIM Ref. No. 168468) and the secretin receptor (OMIM Ref. No. 182098); these receptors comprise a distinct family of G protein- coupled 7- transmembrane domain receptors. A comparison of the human CALCR sequence to protein sequences in databases suggested that the receptor for calcitonin is evolutionarily related to the chemoattractant receptor of the primitive eukaryote Dictyostelium discoideum.

[14054]

[14055] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14056] Gorn, A. H.; Lin, H. Y.; Yamin, M.; Auron, P. E.; Flannery, M. R.; Tapp, D. R.; Manning, C. A.; Lodish, H. F.; Krane, S.

M.; Goldring, S. R. : Cloning, characterization, and expression of a human calcitonin receptor from an ovarian carcinoma cell line. J. Clin. Invest. 90: 1726- 1735, 1992. ; and

[14057] Taboulet, J.; Frenkian, M.; Frendo, J. L.; Feingold, N.; Julienne, A.; de Vernejoul, M. C. : Calcitonin receptor polymorphism is associated with a decreased fracture risk in post- menop.

[14058] Further studies establishing the function and utilities of CALCR are found in John Hopkins OMIM database record ID 114131, and in cited publications listed in Table 5, which are hereby incorporated by reference.Calcium/calmodulin-dependent serine protein kinase (maguk family) (CASK, Accession NP_003679.1) is another GAM94 target gene, herein designated TARGET GENE. CASK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CASK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASK BINDING SITE, designated SEQ ID:11580, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14059] Another function of GAM94 is therefore inhibition of Cal-

cium/calmodulin-dependent serine protein kinase (maguk family) (CASK, Accession NP_003679.1), a gene which is a membrane- associated guanylate kinase and binds to actin- binding protein 4.1 and syndecan- 2. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASK.

[14060] The function of CASK has been established by previous studies. Cohen et al. (1998) determined that CASK interacts with both syndecan- 2 (SDC2; 142460) and the actin-binding band 4.1 protein (OMIM Ref. No. 130500). They suggested that CASK may function as a cytoskeletal membrane scaffold that coordinates signal transduction pathways within the cortical cytoskeleton. To identify binding partners for the guanylate kinase domain of CASK, Hsueh et al. (2000) carried out a yeast 2- hybrid screen of brain complementary DNA libraries, from which TBR1 (OMIM Ref. No. 604616) was isolated. By deletion analysis, the C-terminal region of TBR1 (residues 342 to 681) was found to be necessary and sufficient for association with the guanylate kinase domain of CASK. When coexpressed in COS- 7 cells, TBR1 and CASK were readily coprecipitated by antibodies directed against either individual protein.

Hsueh et al. (2000) demonstrated that CASK enters the nucleus and binds to a specific DNA sequence (the T element) in a complex with TBR1. CASK acts as a coactivator of TBR1 to induce transcription of T element- containing genes, including reelin, a gene that is essential for cerebrocortical development. On the basis of their findings, Hsueh et al. (2000) concluded that a membrane- associated guanylate kinase, which is usually associated with cell junctions, has a transcription regulation function.

[14061]

[14062] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14063] Cohen, A. R.; Wood, D. F.; Marfatia, S. M.; Walther, Z.; Chishti, A. H.; Anderson, J. M. : Human CASK/LIN- 2 binds syndecan- 2 and protein 4.1 and localizes to the basolateral membrane of epithelial cells. J. Cell Biol. 142: 129-138, 1998. ; and

[14064] Hsueh, Y.- P.; Wang, T.- F.; Yang, F.- C.; Sheng, M. : Nuclear transcription and transcription regulation by the membrane- associated guanylate kinase CASK/LIN- 2. Nature 404: 298- 302, 2000.

[14065] Further studies establishing the function and utilities of

CASK are found in John Hopkins OMIM database record ID 300172, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cyclin i (CCNI, Accession NP_006826.1) is another GAM94 target gene, herein designated TARGET GENE. CCNI BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CCNI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCNI BINDING SITE, designated SEQ ID:1699, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14066] Another function of GAM94 is therefore inhibition of Cyclin i (CCNI, Accession NP_006826.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNI.

[14067] CCNL2 (Accession NP_112199.1) is another GAM94 target gene, herein designated TARGET GENE. CCNL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CCNL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCNL2 BINDING SITE, designated SEQ ID:9923, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14068] Another function of GAM94 is therefore inhibition of CCNL2 (Accession NP_112199.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNL2.

[14069] Chemokine (c-c motif) receptor-like 1 (CCRL1, Accession NP_057641.1) is another GAM94 target gene, herein designated TARGET GENE. CCRL1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCRL1 BINDING SITE, designated SEQ ID:19245, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14070] Another function of GAM94 is therefore inhibition of Chemokine (c-c motif) receptor-like 1 (CCRL1, Accession NP_057641.1), a gene which is a G protein- coupled re-

ceptor that binds chemokines of the CC subfamily, especially MCP- 4, ELC (SCYA19) and TECK (SCYA25). Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCRL1.

[14071] The function of CCRL1 has been established by previous studies. Chemokine receptors are members of the 7-transmembrane- spanning, G protein- coupled receptor family that recognize small proteins responsible for the directed migration of specific cell types. Depending on the number of amino acids between the first 2 cysteines of their ligands (they may have more than 1 ligand), chemokine receptors are designated CCR (adjacent cysteines), CXCR (1 amino acid between the cysteines), or CX3CR (3 amino acids between the cysteines). The 'R' designation refers to proteins that not only bind, but also have a signaling function after binding. By searching an EST database for PPR1 homologs, Schweickart et al. (2000) obtained a cDNA encoding CCRL1, which they called CCR11. They initially reported that CCRL1 shares functional similarity to CCR2 (OMIM Ref. No. 601267) because it has a chemotactic response to MCP family chemokines (e.g., MCP2; 602283). However, in an erratum, Schwe-

ickart et al. (2000) corrected their functional data and stated that cells expressing CCRL1 do not have a chemotactic response to MCP family chemokines. They confirmed that CCRL1 binds ELC, SLC, and TECK, as reported by Gosling et al. (2000).

[14072]

[14073] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14074] Schweickart, V. L.; Epp, A.; Raport, C. J.; Gray, P. W. : CCR11 is a functional receptor for the monocyte chemoattractant protein family of chemokines. J. Biol. Chem. 275: 9550- 9556, 2000. Note: Erratum: J. Biol. Chem. 276: 856 only, 2001. ; and

[14075] Gosling, J.; Dairaghi, D. J.; Wang, Y.; Hanley, M.; Talbot, D.; Miao, Z.; Schall, T. J. : Cutting edge: identification of a novel chemokine receptor that binds dendritic cell- and T cel.

[14076] Further studies establishing the function and utilities of CCRL1 are found in John Hopkins OMIM database record ID 606065, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chemokine (c-c motif) receptor-like 1 (CCRL1, Accession

NP_848540.1) is another GAM94 target gene, herein designated TARGET GENE. CCRL1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCRL1 BINDING SITE, designated SEQ ID:19245, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14077] Another function of GAM94 is therefore inhibition of Chemokine (c-c motif) receptor-like 1 (CCRL1, Accession NP_848540.1), a gene which is a G protein- coupled receptor that binds chemokines of the CC subfamily, especially MCP- 4, ELC (SCYA19) and TECK (SCYA25). Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCRL1.

[14078] The function of CCRL1 has been established by previous studies. Chemokine receptors are members of the 7-transmembrane- spanning, G protein- coupled receptor family that recognize small proteins responsible for the directed migration of specific cell types. Depending on the

number of amino acids between the first 2 cysteines of their ligands (they may have more than 1 ligand), chemokine receptors are designated CCR (adjacent cysteines), CXCR (1 amino acid between the cysteines), or CX3CR (3 amino acids between the cysteines). The 'R' designation refers to proteins that not only bind, but also have a signaling function after binding. By searching an EST database for PPR1 homologs, Schweickart et al. (2000) obtained a cDNA encoding CCRL1, which they called CCR11. They initially reported that CCRL1 shares functional similarity to CCR2 (OMIM Ref. No. 601267) because it has a chemotactic response to MCP family chemokines (e.g., MCP2; 602283). However, in an erratum, Schweickart et al. (2000) corrected their functional data and stated that cells expressing CCRL1 do not have a chemotactic response to MCP family chemokines. They confirmed that CCRL1 binds ELC, SLC, and TECK, as reported by Gosling et al. (2000).

[14079]

[14080] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14081] Schweickart, V. L.; Epp, A.; Raport, C. J.; Gray, P. W. :

CCR11 is a functional receptor for the monocyte chemoattractant protein family of chemokines. J. Biol. Chem. 275: 9550- 9556, 2000. Note: Erratum: J. Biol. Chem. 276: 856 only, 2001. ; and

[14082] Gosling, J.; Dairaghi, D. J.; Wang, Y.; Hanley, M.; Talbot, D.; Miao, Z.; Schall, T. J. : Cutting edge: identification of a novel chemokine receptor that binds dendritic cell- and T cel.

[14083] Further studies establishing the function and utilities of CCRL1 are found in John Hopkins OMIM database record ID 606065, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cd28 antigen (tp44) (CD28, Accession NP_006130.1) is another GAM94 target gene, herein designated TARGET GENE. CD28 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CD28, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD28 BINDING SITE, designated SEQ ID:5373, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14084] Another function of GAM94 is therefore inhibition of Cd28

antigen (tp44) (CD28, Accession NP_006130.1), a gene which possibly involved in t- cell activation. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD28.

[14085] The function of CD28 has been established by previous studies. Monoclonal antibodies recognize 3 antigens, CD3 (OMIM Ref. No. 186790), CD2 (OMIM Ref. No. 186990), and CD28 (Tp44), that cause human T cells to proliferate in the presence of phorbol esters. Whereas CD3 appeared to be involved in transduction of the signal generated by antigen binding to the T- cell receptor, the role of the CD2 and CD28 antigens in physiologic proliferation was not understood. Aruffo and Seed (1987) isolated a cDNA clone encoding CD28 by a simple and highly efficient cloning strategy based on transient expression. In COS cells the CD28 encodes a highly glycosylated membrane protein with homology to the immunoglobulin superfamily.

[14086] Animal model experiments lend further support to the function of CD28. CD28 undergoes tyrosine phosphorylation after interacting with its ligand, B7 (CD80; 112203). Phosphorylation of tyr173 (tyr170 in mouse) in the cyto-

plasmic domain of CD28 allows the recruitment of signaling proteins such as phosphatidylinositol 3- kinase (see OMIM Ref. No. PIK3R1; 171833), GRB2 (OMIM Ref. No. 108355), and GADS (GRAP2; 604518) via their SH2 domains. Okkenhaug et al. (2001) reconstituted CD28 knockout mice with transgenes encoding wildtype Cd28 or Cd28 carrying a tyr170- to- phe mutation. Mutant Cd28 did not bind to the SH2 domain of PIK3R1, resulting in diminished protein kinase B (OMIM Ref. No. 164730) activation. Mutant Cd28 was able to prevent the induction of anergy, to promote T- cell proliferation and interleukin- 2 (IL2; 147680) secretion, and to provide B- cell help, but was unable to upregulate expression of the prosurvival protein BCLXL (OMIM Ref. No. 600039). The defect in BCLXL upregulation was correlated with increased susceptibility of the T cells to gamma radiation. Okkenhaug et al. (2001) suggested that other tyrosine residues or asn172 may be critical to functions not affected by the tyr170- to- phe mutation.

[14087] It is appreciated that the abovementioned animal model for CD28 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[14088] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14089] Aruffo, A.; Seed, B. : Molecular cloning of a CD28 cDNA by a high- efficiency COS cell expression system. Proc. Nat. Acad. Sci. 84: 8573- 8577, 1987. ; and

[14090] Okkenhaug, K.; Wu, L.; Garza, K. M.; La Rose, J.; Khoo, W.; Odermatt, B.; Mak, T. W.; Ohashi, P. S.; Rottapel, R. : A point mutation in CD28 distinguishes proliferative signals from sur.

[14091] Further studies establishing the function and utilities of CD28 are found in John Hopkins OMIM database record ID 186760, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cdc14 cell division cycle 14 homolog a (s. cerevisiae) (CDC14A, Accession NP_201570.1) is another GAM94 target gene, herein designated TARGET GENE. CDC14A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDC14A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC14A BINDING SITE, designated SEQ ID:15163, to the

nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14092] Another function of GAM94 is therefore inhibition of Cdc14 cell division cycle 14 homolog a (s. cerevisiae) (CDC14A, Accession NP_201570.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14A.

[14093] Cell division cycle 25a (CDC25A, Accession NP_001780.1) is another GAM94 target gene, herein designated TARGET GENE. CDC25A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDC25A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC25A BINDING SITE, designated SEQ ID:910, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14094] Another function of GAM94 is therefore inhibition of Cell division cycle 25a (CDC25A, Accession NP_001780.1), a gene which is a tyrosine protein phosphatase required for progression of the cell cycle. and therefore may be associated with Oncogenesis. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Oncogen-

esis, and of other diseases and clinical conditions associated with CDC25A.

[14095] The function of CDC25A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.1.Cell division cycle 2-like 1 (pitslre proteins) (CDC2L1, Accession NP_277025.1) is another GAM94 target gene, herein designated TARGET GENE. CDC2L1 BINDING SITE1 and CDC2L1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CDC2L1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC2L1 BINDING SITE1 and CDC2L1 BINDING SITE2, designated SEQ ID:11887 and SEQ ID:11887 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14096] Another function of GAM94 is therefore inhibition of Cell division cycle 2-like 1 (pitslre proteins) (CDC2L1, Accession NP_277025.1), a gene which is a negative regulator of normal cell cycle progression. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with CDC2L1.

[14097] The function of CDC2L1 has been established by previous studies. Bunnell et al. (1990) identified a human cell division control (CDC)- related protein kinase, p58, that is structurally and functionally related to p34(cdc2) (CDC2; 116940). Abnormal expression of the p58 protein kinase in eukaryotic cells had effects suggesting that it is a negative regulator of normal cell cycle progression. The gene is well conserved evolutionarily. Its expression is regulated during murine embryogenesis, and its activity is coordinately regulated with that of p34(cdc2) during the cell cycle. Eipers et al. (1991) assigned the expressed p58 gene to 1p36 by somatic cell hybrid analysis, in situ hybridization, and nested PCR amplification of microdissected chromosomes. The authors stated that this gene, tentatively symbolized PK58, may be implicated in the pathogenesis of tumors that have deletion in the region of 1p36. Eipers et al. (1992) detailed the complete structure of the CDC2L1 gene including its putative promoter region, transcriptional start sites, exonic sequences, and intron/exon boundary sequences. The gene is 10 kb in size and contains 12 exons and 11 introns.

[14098]

[14099] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14100] Bunnell, B.; Heath, L. S.; Adams, D. E.; Lahti, J. M.; Kidd, V. J. : Elevated expression of a p58 protein kinase leads to changes in the CHO cell cycle. Proc. Nat. Acad. Sci. 87: 7467- 7471, 1990. ; and

[14116] Further studies establishing the function and utilities of CDC2L1 are found in John Hopkins OMIM database record ID 176873, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cell division cycle 2-like 2 (CDC2L2, Accession NP_277069.1) is another GAM94 target gene, herein designated TARGET GENE. CDC2L2 BINDING SITE1 through CDC2L2 BINDING SITE5 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CDC2L2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC2L2 BINDING SITE1 through CDC2L2 BINDING SITE5, designated SEQ ID:14067, SEQ ID:2681, SEQ ID:17841, SEQ ID:17841 and SEQ ID:11887

respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14117] Another function of GAM94 is therefore inhibition of Cell division cycle 2-like 2 (CDC2L2, Accession NP_277069.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC2L2.

[14118] Cell division cycle 2-like 2 (CDC2L2, Accession NP_277074.1) is another GAM94 target gene, herein designated TARGET GENE. CDC2L2 BINDING SITE1 through CDC2L2 BINDING SITE5 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CDC2L2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC2L2 BINDING SITE1 through CDC2L2 BINDING SITE5, designated SEQ ID:9626, SEQ ID:9626, SEQ ID:2681, SEQ ID:11887 and SEQ ID:14067 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14119] Another function of GAM94 is therefore inhibition of Cell division cycle 2-like 2 (CDC2L2, Accession NP_277074.1) . Accordingly, utilities of GAM94 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with CDC2L2.

[14120] CDGAP (Accession XP_291085.1) is another GAM94 target gene, herein designated TARGET GENE. CDGAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDGAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDGAP BINDING SITE, designated SEQ ID:657, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14121] Another function of GAM94 is therefore inhibition of CDGAP (Accession XP_291085.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDGAP.

[14122] Cadherin 1, type 1, e-cadherin (epithelial) (CDH1, Accession NP_004351.1) is another GAM94 target gene, herein designated TARGET GENE. CDH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CDH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of CDH1 BINDING SITE, designated SEQ ID:15908, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14123] Another function of GAM94 is therefore inhibition of Cadherin 1, type 1, e-cadherin (epithelial) (CDH1, Accession NP_004351.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH1.

[14124] Cadherin 18, type 2 (CDH18, Accession NP_004925.1) is another GAM94 target gene, herein designated TARGET GENE. CDH18 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CDH18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDH18 BINDING SITE, designated SEQ ID:14157, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14125] Another function of GAM94 is therefore inhibition of Cadherin 18, type 2 (CDH18, Accession NP_004925.1), a gene which mediates neural cell- cell interactions and may play an important role in neural development. Accordingly, utilities of GAM94 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with CDH18.

[14126] The function of CDH18 has been established by previous studies. To isolate cDNAs encoding proteins that interact with beta- catenin, Shibata et al. (1997) screened a human adult brain cDNA expression library with recombinant beta- catenin protein. They identified a cDNA with high sequence homology to cadherin molecules and designated it cadherin- 14 (CDH14), which has been renamed cadherin- 18 (CDH18). Comparison of the deduced 790- amino acid CDH18 sequence with the sequences of other cadherins revealed that CDH18 is more closely related to type 2 cadherins than to type 1 cadherins, with the N- terminal regions of CDH18 and CDH12 (OMIM Ref. No. 600562) showing particularly high amino acid similarity. Northern blot analysis of human tissues detected 9.7-, 5.5-, and 3.9- kb CDH18 transcripts specifically in the central nervous system; CDH18 expression was also found in small- cell lung carcinoma cell lines, which have neuroectodermal cell phenotypes

[14127]

[14128] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[14129] Chalmers, I. J.; Hofler, H.; Atkinson, M. J. : Mapping of a cadherin gene cluster to a region of chromosome 5 subject to frequent allelic loss in carcinoma. Genomics 57: 160- 163, 1999. ; and

[14130] Shibata, T.; Shimoyama, Y.; Gotoh, M.; Hirohashi, S. : Identification of human cadherin- 14, a novel neurally specific type II cadherin, by protein interaction cloning. J. Biol. Chem. 2.

[14131] Further studies establishing the function and utilities of CDH18 are found in John Hopkins OMIM database record ID 603019, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cyclin-dependent kinase inhibitor 2c (p18, inhibits cdk4) (CDKN2C, Accession NP_523240.1) is another GAM94 target gene, herein designated TARGET GENE. CDKN2C BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CDKN2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDKN2C BINDING SITE, designated SEQ ID:5149, to the nucleotide sequence of

GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14132] Another function of GAM94 is therefore inhibition of Cyclin-dependent kinase inhibitor 2c (p18, inhibits cdk4) (CDKN2C, Accession NP_523240.1), a gene which associate with cyclin- CDK complexes or CDKs alone and inhibit their activity and therefore may be associated with Breast tumors. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Breast tumors, and of other diseases and clinical conditions associated with CDKN2C.

[14133] The function of CDKN2C has been established by previous studies. Cyclin- dependent kinase inhibitors (CKIs) are a group of low molecular weight proteins that associate with cyclin- CDK complexes or CDKs alone and inhibit their activity. Members of the INK4 family of CKIs specifically bind and inhibit CDK4 (OMIM Ref. No. 123829) and CDK6 (OMIM Ref. No. 603368), thereby preventing cyclin D- dependent phosphorylation of RB1 (OMIM Ref. No. 180200). See INK4D (OMIM Ref. No. 600927). By using a yeast 2- hybrid screen to search for CDK6- interacting proteins, Guan et al. (1994) isolated a partial cDNA encoding a protein that they designated p18 based on its

molecular mass of 18 kD. They used the partial cDNA to screen a HeLa cell library and recovered additional cDNAs corresponding to the entire p18 coding region. Sequence analysis revealed that the predicted 168- amino acid p18 protein shares 38% and 42% sequence identity with p16/INK4A (OMIM Ref. No. 600160) and p14/INK4B (OMIM Ref. No. 600431), respectively. Like p14 and p16, p18 contains an ankyrin repeat domain. Both in vivo and in vitro, p18 interacted strongly with CDK6 and weakly with CDK4, but not with the other CDKs tested. Recombinant p18 inhibited the kinase activity of cyclin D- CDK6 in vitro. Ectopic expression of either p16 or p18 suppressed the growth of human cells in a manner that appears to correlate with the presence of a wildtype RB1 function. Using Northern blot analysis, Guan et al. (1994) found that p18 is expressed as multiple transcripts in various human tissues, with the strongest expression in skeletal muscle. Blais et al. (1998) determined that the p18, or INK4C, gene contains 3 exons and spans more than 7.5 kb. Lapointe et al. (1996) identified a single amino acid substitution (ala72 to pro; A72P) in BT- 20 human breast cancer cells that abrogated the ability of p18 to interact with CDK6 and to suppress cell growth. These authors

suggested that p18 inactivation by point mutations may contribute to deregulated growth control in certain cell lines and/or tumors. Blais et al. (1998) found this p18 variant in 3 of 35 breast tumors examined, and suggested that it may be a polymorphism.

[14134]

[14135] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14136] Blais, A.; Labrie, Y.; Pouliot, F.; Lachance, Y.; Labrie, C. : Structure of the gene encoding the human cyclin- depen- dent kinase inhibitor p18 and mutational analysis in breast cancer. Biochem. Biophys. Res. Commun. 247: 146- 153, 1998. ; and

[14137] Lapointe, J.; Lachance, Y.; Labrie, Y.; Labrie, C. : A p18 mutant defective in CDK6 binding in human breast cancer cells. Cancer Res. 56: 4586- 4589, 1996.

[14138] Further studies establishing the function and utilities of CDKN2C are found in John Hopkins OMIM database record ID 603369, and in cited publications listed in Table 5, which are hereby incorporated by reference.CDT6 (Accession NP_066969.1) is another GAM94 target gene, herein designated TARGET GENE. CDT6 BINDING SITE is a

target binding site found in the 5` untranslated region of mRNA encoded by CDT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDT6 BINDING SITE, designated SEQ ID:7162, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14139] Another function of GAM94 is therefore inhibition of CDT6 (Accession NP_066969.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDT6.

[14140] CGI-104 (Accession NP_057230.1) is another GAM94 target gene, herein designated TARGET GENE. CGI-104 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CGI-104, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CGI-104 BINDING SITE, designated SEQ ID:18497, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14141] Another function of GAM94 is therefore inhibition of CGI-

104 (Accession NP_057230.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-104.

[14142] CGI-85 (Accession NP_057112.2) is another GAM94 target gene, herein designated TARGET GENE. CGI-85 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CGI-85, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CGI-85 BINDING SITE, designated SEQ ID:5217, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14143] Another function of GAM94 is therefore inhibition of CGI-85 (Accession NP_057112.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-85.

[14144] Chromodomain helicase dna binding protein 1-like (CHD1L, Accession NP_078844.1) is another GAM94 target gene, herein designated TARGET GENE. CHD1L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHD1L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHD1L BINDING SITE, designated SEQ ID:18799, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14145] Another function of GAM94 is therefore inhibition of Chromodomain helicase dna binding protein 1-like (CHD1L, Accession NP_078844.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHD1L.

[14146] Cholinergic receptor, muscarinic 5 (CHRM5, Accession NP_036257.1) is another GAM94 target gene, herein designated TARGET GENE. CHRM5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CHRM5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHRM5 BINDING SITE, designated SEQ ID:18498, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14147] Another function of GAM94 is therefore inhibition of Cholinergic receptor, muscarinic 5 (CHRM5, Accession

NP_036257.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRM5.

[14148] Cholinergic receptor, nicotinic, beta polypeptide 2 (neuronal) (CHRNB2, Accession NP_000739.1) is another GAM94 target gene, herein designated TARGET GENE. CHRNB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHRNB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHRNB2 BINDING SITE, designated SEQ ID:17099, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14149] Another function of GAM94 is therefore inhibition of Cholinergic receptor, nicotinic, beta polypeptide 2 (neuronal) (CHRNB2, Accession NP_000739.1), a gene which mediates fast signal transmission at synapses. and therefore is associated with Epilepsy, nocturnal frontal lobe, type 3. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Epilepsy, nocturnal frontal lobe, type 3, and of other diseases and clinical conditions associated with CHRNB2.

[14150] The function of CHRNB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Carbohydrate (keratan sulfate gal-6) sulfotransferase 1 (CHST1, Accession NP_003645.1) is another GAM94 target gene, herein designated TARGET GENE. CHST1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CHST1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHST1 BINDING SITE, designated SEQ ID:11016, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14151] Another function of GAM94 is therefore inhibition of Carbohydrate (keratan sulfate gal-6) sulfotransferase 1 (CHST1, Accession NP_003645.1), a gene which may play a role in keratan sulfate biosynthesis in brain and cornea. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST1.

[14152] The function of CHST1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM63.1.Chemokine-like factor super family 6 (CKLFSF6, Accession NP_060271.1) is another GAM94 target gene, herein designated TARGET GENE. CKLFSF6 BINDING SITE1 and CKLFSF6 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CKLFSF6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CKLFSF6 BINDING SITE1 and CKLFSF6 BINDING SITE2, designated SEQ ID:1874 and SEQ ID:14312 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14153] Another function of GAM94 is therefore inhibition of Chemokine-like factor super family 6 (CKLFSF6, Accession NP_060271.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKLFSF6.

[14154] Chloride channel 4 (CLCN4, Accession NP_001821.1) is another GAM94 target gene, herein designated TARGET GENE. CLCN4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by

CLCN4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLCN4 BINDING SITE, designated SEQ ID:12401, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14155] Another function of GAM94 is therefore inhibition of Chloride channel 4 (CLCN4, Accession NP_001821.1), a gene which is regulation of cell volume; membrane potential stabilization, signal transduction and transepithelial transport. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN4.

[14156] The function of CLCN4 has been established by previous studies. In the course of constructing a comprehensive transcript map of the Xp22.3 region, van Slegtenhorst et al. (1994) identified an evolutionarily conserved CpG island and cloned the corresponding gene. The predicted 760- amino acid protein contained 12 hydrophobic domains and shared sequence and structural similarities with all the previously isolated members of the family of voltage- gated chloride channels. The gene, termed CLCN4, for chloride channel 4, contained at least 10 ex-

ons spanning 60 to 80 kb. In contrast with most genes isolated from the Xp22.3 region, CLCN4 did not share homology with the Y chromosome, but was conserved in mouse and hamster. Expression studies demonstrated a 7.5- kb transcript that is particularly abundant in skeletal muscle and also detectable in brain and heart. Thus, this gene encodes a newly identified voltage- gated chloride channel. Rugarli et al. (1995) found that in the wild Mediterranean mouse Mus spretus, the Cln4 gene maps to the X chromosome as it does in the human; however, in the inbred strain of laboratory mouse C57BL/6J, they found that it maps to chromosome 7. Findings indicated that a recent evolutionary rearrangement occurred in the mouse sex chromosomes very close to the pseudoautosomal region (PAR). The data were considered molecular evidence for a major divergence near the pseudoautosomal region consistent with the hypothesis that hybrid sterility in these species results from abnormal pairing of sex chromosomes during male meiosis. They found that Cln4 is the closest cloned gene to the M. spretus pseudoautosomal region and the most distal locus displaying a conserved position between the human and this mouse locus. The X- inactivation status of the locus in M. spretus was

demonstrated by the finding that in F1 females from a cross between M. spretus and an inbred- derived mouse carrying the t(X;16)16H balanced translocation, it was always the normal M. spretus X chromosome that was inactive in adult tissues. This completely skewed X inactivation provided a system for assaying expression of genes from the inactive X chromosome once the parental alleles could be distinguished. Palmer et al. (1995) likewise found what they referred to as 'contravention of Ohno's law' in the course of mapping a cDNA mouse Cln4 in an interspecific backcross. This was the first example of a gene unique to the X chromosome in 1 eutherian species but autosomal in another. The consequence of this chromosomal rearrangement was that the gene was lost by mendelian segregation in a subset of the male progeny of a (C57BL/6 x Mus spretus) x Mus spretus backcross.

[14157]

[14158] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14159] Rugarli, E. I.; Adler, D. A.; Borsani, G.; Tsuchiya, K.; Franco, B.; Hauge, X.; Disteche, C.; Chapman, V.; Ballabio, A. : Different chromosomal localization of the Clcn4 gene

in Mus spretus and C57BL/6J mice. Nature Genet. 10: 466- 471, 1995. ; and

[14160] van Slegtenhorst, M. A.; Bassi, M. T.; Borsani, G.; Wapenaar, M. C.; Ferrero, G. B.; de Conciliis, L.; Rugarli, E. I.; Grillo, A.; Franco, B.; Zoghbi, H. Y.; Ballabio, A. : A gene from.

[14161] Further studies establishing the function and utilities of CLCN4 are found in John Hopkins OMIM database record ID 302910, and in cited publications listed in Table 5, which are hereby incorporated by reference.Claudin 14 (CLDN14, Accession NP_652763.1) is another GAM94 target gene, herein designated TARGET GENE. CLDN14 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CLDN14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLDN14 BINDING SITE, designated SEQ ID:5051, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14162] Another function of GAM94 is therefore inhibition of Claudin 14 (CLDN14, Accession NP_652763.1), a gene which provides structural support for the auditory neu-

roepithelium. and therefore is associated with Deafness. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Deafness., and of other diseases and clinical conditions associated with CLDN14.

[14163] The function of CLDN14 has been established by previous studies. By sequencing the long arm of chromosome 21, Hattori et al. (2000) identified the CLDN14 gene. Using RACE, Wilcox et al. (2001) amplified a cDNA encoding CLDN14 from human liver cDNA. Comparison of the genomic chromosome 21 sequence with the cDNA sequence indicated that the CLDN14 gene contains 3 exons, and the authors identified 2 splice isoforms, one with and the other without exon 2. Northern blot analysis detected CLDN14 expression in liver and kidney. In situ hybridization and immunofluorescence studies revealed mouse Cldn14 expression in the sensory epithelium of the organ of Corti. By sequence analysis of chromosome 21q, Hattori et al. (2000) mapped the CLDN14 gene to 21q22.3. Wilcox et al. (2001) showed that the profound, congenital, recessive deafness segregating in 2 Pakistani families, PKSN6 and PKSR9a, defines a novel locus, DFNB29, on 21q22.1. These families supported maximum 2- point lod scores of 6.7 at theta of zero for the marker D21S1252

and 6.1 at theta of zero for marker D21S2079, respectively. Critical recombinants and homozygosity for polymorphic markers defined a DFNB29 linkage interval of 228,600 bp on 21q22.1. Since the CLDN14 gene maps within the critical interval and was considered a good candidate, Wilcox et al. (2001) examined the sequence of its single protein- coding exon. In affected individuals of family PKSN6, they identified a homozygous 1- bp deletion (398delT; 605608.0001), while in family PKSR9a they identified a val85- to- asp missense mutation (605608.0002). Val85 is conserved among 12 of the 20 claudins, while isoleucine is present among 5 claudins, and the remaining 3 claudins have either a cysteine or a proline at this position of the consensus molecule. Aspartic acid at position 85 was predicted to affect hydrophobicity and disrupt the predicted secondary structures in transmembrane domain 2.

[14164]

[14165] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14166] Hattori, M.; Fujiyama, A.; Taylor, T. D.; Watanabe, H.; Yada, T.; Park, H.- S.; Toyoda, A.; Ishii, K.; Totoki, Y.;

Choi, D.- K.; Groner, Y.; Soeda, E.; and 52 others : The DNA sequence of human chromosome 21. Nature 405: 311- 319, 2000. Note: Erratum: Nature: 407: 110 only, 2000. ; and

[14167] Wilcox, E. R.; Burton, Q. L.; Naz, S.; Riazuddin, S.; Smith, T. N.; Ploplis, B.; Belyatseva, I.; Ben- Yosef, T.; Liburd, N. A.; Morell, R. J.; Kachar, B.; Wu, D. K.; Griffith, A. J.; Ri.

[14168] Further studies establishing the function and utilities of CLDN14 are found in John Hopkins OMIM database record ID 605608, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cdc-like kinase 3 (CLK3, Accession NP_001283.1) is another GAM94 target gene, herein designated TARGET GENE. CLK3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CLK3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLK3 BINDING SITE, designated SEQ ID:18588, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14169] Another function of GAM94 is therefore inhibition of Cdc-like kinase 3 (CLK3, Accession NP_001283.1) . Accord-

ingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLK3.

[14170] Cyclin m1 (CNNM1, Accession NP_065081.1) is another GAM94 target gene, herein designated TARGET GENE. CNNM1 BINDING SITE1 and CNNM1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CNNM1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE1 and CNNM1 BINDING SITE2, designated SEQ ID:1194 and SEQ ID:7736 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14171] Another function of GAM94 is therefore inhibition of Cyclin m1 (CNNM1, Accession NP_065081.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1.

[14172] Ccr4-not transcription complex, subunit 4 (CNOT4, Accession NP_037448.1) is another GAM94 target gene, herein designated TARGET GENE. CNOT4 BINDING SITE is

a target binding site found in the 3` untranslated region of mRNA encoded by CNOT4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNOT4 BINDING SITE, designated SEQ ID:9013, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14173] Another function of GAM94 is therefore inhibition of Ccr4-not transcription complex, subunit 4 (CNOT4, Accession NP_037448.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT4.

[14174] Cannabinoid receptor 2 (macrophage) (CNR2, Accession NP_001832.1) is another GAM94 target gene, herein designated TARGET GENE. CNR2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CNR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNR2 BINDING SITE, designated SEQ ID:15470, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14175] Another function of GAM94 is therefore inhibition of Cannabinoid receptor 2 (macrophage) (CNR2, Accession NP_001832.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNR2.

[14176] Collagen, type xvii, alpha 1 (COL17A1, Accession NP_570134.1) is another GAM94 target gene, herein designated TARGET GENE. COL17A1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COL17A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL17A1 BINDING SITE, designated SEQ ID:4162, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14177] Another function of GAM94 is therefore inhibition of Collagen, type xvii, alpha 1 (COL17A1, Accession NP_570134.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL17A1.

[14178] Collagen, type xvii, alpha 1 (COL17A1, Accession NP_000485.2) is another GAM94 target gene, herein des-

ignated TARGET GENE. COL17A1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COL17A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL17A1 BINDING SITE, designated SEQ ID:4162, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14179] Another function of GAM94 is therefore inhibition of Collagen, type xvii, alpha 1 (COL17A1, Accession NP_000485.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL17A1.

[14180] Collagen, type xix, alpha 1 (COL19A1, Accession NP_001849.1) is another GAM94 target gene, herein designated TARGET GENE. COL19A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COL19A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL19A1 BINDING SITE, designated SEQ ID:19736, to the nucleotide sequence of

GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14181] Another function of GAM94 is therefore inhibition of Collagen, type xix, alpha 1 (COL19A1, Accession NP_001849.1), a gene which may act as a cross- bridge between fibrils and other extracellular matrix molecules. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL19A1.

[14182] The function of COL19A1 has been established by previous studies. The collagens are a large superfamily of genes that include a number of subgroups. One such group is composed of fibrillar associated collagens with interrupted triple helices (FACIT) and includes collagen types IX (e.g., 120210), XII (e.g., 120320), XIV (e.g., 120324), and XVI (e.g., 120326). Members of this group have common structural features, including short stretches of collagenous domains interrupted by non-collagenous regions. These, in turn, form functional units that serve to produce adhesion to the fibrils, provide a rigid arm that projects from the fibril and provide a point of interaction with other matrix components Yoshioka et al. (1992) mapped the COL19A1 gene to 6q12- q14,

where the COL9A1 gene (OMIM Ref. No. 120210) has been mapped. Myers et al. (1993) mapped the COL19A1 gene to chromosome 6 by analysis of a panel of somatic cell hybrids. By FISH, Gerecke et al. (1997) mapped the COL19A1 gene to 6q12- q13. Khaleduzzaman et al. (1997) showed that the mouse Col19a1 gene is located on chromosome 1A3, where Col9a1 had also been mapped. They suggested that COL19A1 and COL9A1, and their murine counterparts, were duplicated from the same ancestral gene of the FACIT family

[14183]

[14184] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14185] Yoshioka, H.; Zhang, H.; Ramirez, F.; Mattei, M.- G.; Moradi- Ameli, M.; van der Rest, M.; Gordon, M. K. : Synteny between the loci for a novel FACIT- like collagen (D6S228E) and alpha 1(IX) collagen (COL9A1) on 6q12- q14 in humans. Genomics 13: 884- 886, 1992. ; and

[14186] Yoshioka, H.; Zhang, H.; Ramirez, F.; Mattei, M.- G.; Moradi- Ameli, M.; van der Rest, M.; Gordon, M. K. : Synteny between the loci for a novel FACIT- like collagen (D6S228E) and alpha 1(IX.

[14187] Further studies establishing the function and utilities of COL19A1 are found in John Hopkins OMIM database record ID 120165, and in cited publications listed in Table 5, which are hereby incorporated by reference.COL22A1 (Accession XP_291257.2) is another GAM94 target gene, herein designated TARGET GENE. COL22A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COL22A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL22A1 BINDING SITE, designated SEQ ID:17151, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14188] Another function of GAM94 is therefore inhibition of COL22A1 (Accession XP_291257.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL22A1.

[14189] Crm, cramped-like (drosophila) (CRAMP1L, Accession XP_034570.4) is another GAM94 target gene, herein designated TARGET GENE. CRAMP1L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CRAMP1L, corresponding to a target binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRAMP1L BINDING SITE, designated SEQ ID:17653, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14190] Another function of GAM94 is therefore inhibition of Crm, cramped-like (drosophila) (CRAMP1L, Accession XP_034570.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRAMP1L.

[14191] CREG2 (Accession NP_722578.1) is another GAM94 target gene, herein designated TARGET GENE. CREG2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CREG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CREG2 BINDING SITE, designated SEQ ID:5574, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14192] Another function of GAM94 is therefore inhibition of CREG2 (Accession NP_722578.1) . Accordingly, utilities of

GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CREG2.

[14193] Cysteine-rich motor neuron 1 (CRIM1, Accession NP_057525.1) is another GAM94 target gene, herein designated TARGET GENE. CRIM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CRIM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRIM1 BINDING SITE, designated SEQ ID:18711, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14194] Another function of GAM94 is therefore inhibition of Cysteine-rich motor neuron 1 (CRIM1, Accession NP_057525.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRIM1.

[14195] CRK7 (Accession NP_057591.1) is another GAM94 target gene, herein designated TARGET GENE. CRK7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CRK7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of CRK7 BINDING SITE, designated SEQ ID:16784, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14196] Another function of GAM94 is therefore inhibition of CRK7 (Accession NP_057591.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRK7.

[14197] CRN (Accession NP_006578.2) is another GAM94 target gene, herein designated TARGET GENE. CRN BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CRN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRN BINDING SITE, designated SEQ ID:19629, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14198] Another function of GAM94 is therefore inhibition of CRN (Accession NP_006578.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRN.

[14199] Colony stimulating factor 1 receptor, formerly mcdonough

feline sarcoma viral (v-fms) oncogene homolog (CSF1R, Accession NP_005202.2) is another GAM94 target gene, herein designated TARGET GENE. CSF1R BINDING SITE1 through CSF1R BINDING SITE5 are target binding sites found in untranslated regions of mRNA encoded by CSF1R, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSF1R BINDING SITE1 through CSF1R BINDING SITE5, designated SEQ ID:15322, SEQ ID:6055, SEQ ID:1086, SEQ ID:9658 and SEQ ID:2612 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14200] Another function of GAM94 is therefore inhibition of Colony stimulating factor 1 receptor, formerly mcdonough feline sarcoma viral (v-fms) oncogene homolog (CSF1R, Accession NP_005202.2), a gene which is involved in regulation of growth and differentiation of myeloid cells and therefore may be associated with Myeloid malignancy, predisposition to. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Myeloid malignancy, predisposition to, and of other diseases and clinical conditions associated with CSF1R.

[14201] The function of CSF1R has been established by previous studies. The FMS oncogene was assigned to chromosome 5 by study of mouse- man somatic cell hybrids. The location was narrowed to 5q34 by the study of hamster- human cell hybrids with well- defined deletions of 5q (Groffen et al., 1984). The order on the long arm was found to be centromere- - leuS- - HEXB- - EMTB- - CFMS- - CHR. By in situ hybridization, Le Beau et al. (1986) assigned FMS to 5q33 and GMCSF (OMIM Ref. No. 138960) to 5q23- q31. Both genes were deleted in the 5q- chromosome from bone marrow cells of 2 patients with refractory anemia and del(5)(q15q33.3). From study of other cases they concluded that FMS is located in band 5q33.2 or 5q33.3 rather than 5q34- q35 as reported earlier. The FMS oncogene is the same as the receptor for colony- stimulating factor- 1, otherwise known as macrophage colony- stimulating factor (OMIM Ref. No. 120420). Kondo et al. (2000) showed that a clonogenic common lymphoid progenitor, a bone marrow- resident cell that gives rise exclusively to lymphocytes (T, B, and natural killer cells), can be redirected to the myeloid lineage by stimulation through exogenously expressed interleukin- 2 receptor (OMIM Ref. No. 146710) and GMCSF

receptor (138981, 306250). Analysis of mutants of the beta- chain of the IL2 receptor revealed that the granulocyte and monocyte differentiation signals are triggered by different cytoplasmic domains, showing that the signaling pathways responsible for these unique developmental outcomes are separable. Finally, Kondo et al. (2000) showed that the endogenous myelomonocytic cytokine receptors for GM- CSF and macrophage colony- stimulating factor (CSF1R) are expressed at low to moderate levels on the more primitive hematopoietic stem cells, are absent on common lymphoid progenitors, and are upregulated after myeloid lineage induction by IL2 (OMIM Ref. No. 147680). Kondo et al. (2000) concluded that cytokine signaling can regulate cell fate decisions and proposed that a critical step in lymphoid commitment is downregulation of cytokine receptors that drive myeloid cell development

[14202]

[14203] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14204] Le Beau, M. M.; Westbrook, C. A.; Diaz, M. O.; Larson, R. A.; Rowley, J. D.; Gasson, J. C.; Golde, D. W.; Sherr, C. J. :

Evidence for the involvement of GM- CSF and FMS in the deletion (5q) in myeloid disorders. Science 231: 984- 987, 1986. ; and

[14205] Kondo, M.; Scherer, D. C.; Miyamoto, T.; King, A. G.; Akashi, K.; Sugamura, K.; Weissman, I. L. : Cell- fate conversion of lymphoid- committed progenitors by instructive actions of cytoki.

[14206] Further studies establishing the function and utilities of CSF1R are found in John Hopkins OMIM database record ID 164770, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chondroitin sulfate proteoglycan 3 (neurocan) (CSPG3, Accession NP_004377.1) is another GAM94 target gene, herein designated TARGET GENE. CSPG3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CSPG3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSPG3 BINDING SITE, designated SEQ ID:5105, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14207] Another function of GAM94 is therefore inhibition of Chondroitin sulfate proteoglycan 3 (neurocan) (CSPG3,

Accession NP_004377.1), a gene which may play a role in modulating cell adhesion and migrationn. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSPG3.

[14208] The function of CSPG3 has been established by previous studies. Neurocan was first described in the early postnatal rat brain where it accounts for 20 to 30% of the total chondroitin sulfate proteoglycan. Rauch et al. (1992) cloned the rat cDNA using degenerate primers based on partial amino acid sequence of immunoaffinity- purified protein. The mouse neurocan cDNA encodes a deduced 1,257- amino acid protein with a predicted molecular mass of 136 kD. The large protein is processed into a smaller form in the adult brain. The predicted protein has a 22- amino acid signal peptide followed by an immunoglobin- like domain and repeating motifs characteristic of the hyaluronic acid- binding region of aggregating proteoglycans. The C terminus shows approximately 60% identity to the fibroblast and cartilage proteoglycans versican (OMIM Ref. No. 118661) and aggrecan (OMIM Ref. No. 155760). Northern blots detected a 7.5- kb transcript from 4- day and adult rat brains Prange et al. (1998)

cloned human neurocan cDNAs from infant and adult brain cDNA libraries. The deduced 1,321- amino acid protein shares 63% sequence identity with both mouse and rat neurocan proteins. Like other known proteoglycans, its N terminus contains an immunoglobulin domain and a series of hyaluronic acid- binding tandem repeats, and its C terminus contains an EGF- like domain, a lectin-like domain, and a complement regulatory- like domain. Northern blot analysis detected expression of a 7.5- kb transcript in fetal and adult tissues from all brain regions tested

[14209]

[14210] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14211] Rauch, U.; Grimpe, B.; Kulbe, G.; Arnold- Ammer, I.; Beier, D. R.; Fassler, R. : Structure and chromosomal localization of the mouse neurocan gene. Genomics 28: 405- 410, 1995. ; and

[14212] Prange, C. K.; Pennacchio, L. A.; Lieuallen, K.; Fan, W.; Lennon, G. G. : Characterization of the human neurocan gene, CSPG3. Gene 221: 199- 205, 1998.

[14213] Further studies establishing the function and utilities of

CSPG3 are found in John Hopkins OMIM database record ID 600826, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chemokine (c-x-c motif) ligand 1 (melanoma growth stimulating activity, alpha) (CXCL1, Accession NP_001502.1) is another GAM94 target gene, herein designated TARGET GENE. CXCL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CXCL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CXCL1 BINDING SITE, designated SEQ ID:10919, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14214] Another function of GAM94 is therefore inhibition of Chemokine (c-x-c motif) ligand 1 (melanoma growth stimulating activity, alpha) (CXCL1, Accession NP_001502.1), a gene which has chemotactic activity for neutrophils and may play a role in inflammation. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL1.

[14215] The function of CXCL1 has been established by previous

studies. Melanoma growth stimulatory activity (MGSA) is a mitogenic polypeptide secreted by human melanoma cells. The mature form is maximally 73 amino acids long. MGSA is structurally related to the platelet- derived beta-thromboglobulin. It is the product of the gene GRO isolated by Anisowicz et al. (1987). Horuk et al. (1993) indicated that structurally MGSA belongs to a superfamily of proteins that includes interleukin- 8 (IL8, or CXCR2; 146928) and platelet factor- 4 (PF4; 173460). These proteins are involved in inflammatory processes. Tsai et al. (2002) demonstrated a role for rodent Cxcl1 and Cxcr2 in patterning the developing spinal cord. Signaling through Cxcr2, Cxcl1 inhibited oligodendrocyte precursor migration. The migrational arrest was rapid, reversible, and concentration dependent, and it reflected enhanced cell/substrate interactions. White matter expression of Cxcl1 was temporospatially regulated. Developing Cxcr2 null spinal cords contained reduced oligodendrocytes abnormally concentrated at the periphery. In mouse and rat slice preparations, Cxcl1 inhibited embryonic oligodendrocyte precursor migration, and widespread dispersal of postnatal precursors occurred in the absence of Cxcr2 signaling. The data suggested that a population of pre-

sumptive white matter by oligodendrocyte precursors is dependent on localized expression of CXCL1.

[14216]

[14217] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14218] Horuk, R.; Yansura, D. G.; Reilly, D.; Spencer, S.; Bourell, J.; Henzel, W.; Rice, G.; Unemori, E. : Purification, receptor binding analysis, and biological characterization of human melanoma growth stimulating activity (MGSA): evidence for a novel MGSA receptor. [14220] Further studies establishing the function and utilities of CXCL1 are found in John Hopkins OMIM database record ID 155730, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chemokine (c-x-c motif) ligand 2 (CXCL2, Accession NP_002080.1) is another GAM94 target gene, herein designated TARGET GENE. CXCL2 BINDING SITE is a target binding site found

in the 3` untranslated region of mRNA encoded by CXCL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CXCL2 BINDING SITE, designated SEQ ID:10919, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14221] Another function of GAM94 is therefore inhibition of Chemokine (c-x-c motif) ligand 2 (CXCL2, Accession NP_002080.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL2.

[14222] Chromosome y open reading frame 14 (CYorf14, Accession NP_061012.1) is another GAM94 target gene, herein designated TARGET GENE. CYorf14 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYorf14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYorf14 BINDING SITE, designated SEQ ID:8844, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14223] Another function of GAM94 is therefore inhibition of Chromosome y open reading frame 14 (CYorf14, Accession NP_061012.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYorf14.

[14224] Cytochrome p450, subfamily iiia, polypeptide 7 (CYP3A7, Accession NP_000756.1) is another GAM94 target gene, herein designated TARGET GENE. CYP3A7 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CYP3A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP3A7 BINDING SITE, designated SEQ ID:13918, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14225] Another function of GAM94 is therefore inhibition of Cytochrome p450, subfamily iiia, polypeptide 7 (CYP3A7, Accession NP_000756.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP3A7.

[14226] Cytochrome p450, subfamily ivf, polypeptide 3 (leukotriene b4 omega hydroxylase) (CYP4F3, Accession

NP_000887.1) is another GAM94 target gene, herein designated TARGET GENE. CYP4F3 BINDING SITE1 and CYP4F3 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CYP4F3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP4F3 BINDING SITE1 and CYP4F3 BINDING SITE2, designated SEQ ID:17402 and SEQ ID:18277 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14227] Another function of GAM94 is therefore inhibition of Cytochrome p450, subfamily ivf, polypeptide 3 (leukotriene b4 omega hydroxylase) (CYP4F3, Accession NP_000887.1), a gene which converts leukotriene B4 into the less active 20- hydroxy- leukotriene B4. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP4F3.

[14228] The function of CYP4F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.1.Cytochrome p450, subfamily viib (oxysterol 7

alpha-hydroxylase), polypeptide 1 (CYP7B1, Accession NP_004811.1) is another GAM94 target gene, herein designated TARGET GENE. CYP7B1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP7B1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP7B1 BINDING SITE, designated SEQ ID:4296, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14229] Another function of GAM94 is therefore inhibition of Cytochrome p450, subfamily viib (oxysterol 7 alpha-hydroxylase), polypeptide 1 (CYP7B1, Accession NP_004811.1), a gene which functions in the acidic pathway of bile acid biosynthesis. and therefore is associated with Neonatal giant cell hepatitis. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Neonatal giant cell hepatitis., and of other diseases and clinical conditions associated with CYP7B1.

[14230] The function of CYP7B1 has been established by previous studies. Setchell et al. (1998) determined that the CYP7B1 gene contains 6 exons. The positions of the 5 introns are

identical to those of the CYP7A1 gene. By radiation hybrid analysis, Setchell et al. (1998) mapped the CYP7A1 gene to 8q21.13 and the CYP7B1 gene to 8q21.3. The close linkage of the genes and their shared exon- intron structures suggested that they arose via an ancient duplication event. Setchell et al. (1998) described a metabolic defect in bile acid synthesis involving a deficiency in 7- alpha- hydroxylation due to a mutation in the gene for the microsomal oxysterol 7- alpha- hydroxylase enzyme, active in the acidic pathway for bile acid synthesis. The defect, identified in a 10- week- old boy presenting with severe cholestasis, cirrhosis, and liver synthetic failure, was established by fast atom bombardment ionization- mass spectrometry, which revealed elevated urinary bile acid excretion, a mass spectrum with intense ions at m/z 453 and m/z 510 corresponding to sulfate and glycosulfate conjugates of unsaturated monohydroxycholenoic acids, and an absence of primary bile acids. Levels of 27- hydroxycholesterol were more than 4,500 times normal. Hepatic microsomal oxysterol 7- alpha- hydroxylase activity was undetectable. It was thought that an accumulation of hepatotoxic unsaturated monohydroxy bile acids accounted for the pathology. Gene analysis demonstrated

a C- to- T transition in exon 5 of the CYP7A1 gene, resulting in the conversion of an arginine codon at position 388 to a stop codon. The truncated protein was inactive when expressed in 293 cells. These findings indicated the quantitative importance of the acidic pathway in early life in humans and defined a further inborn error of bile acid synthesis as a metabolic cause of severe cholestatic liver disease.

[14231] Animal model experiments lend further support to the function of CYP7B1. Using immunoblotting, Li- Hawkins et al. (2000) detected higher levels of Cyp7b1 protein in the liver and kidney of male mice compared with female mice. Li- Hawkins et al. (2000) produced mice carrying a targeted disruption in Cyp7b1. The knockout mice had elevated levels of 2 different oxysterols, 25- hydroxycholesterol and 27- hydroxycholesterol, in serum and tissue. De novo cholesterol synthesis was decreased by approximately 40% in the kidneys of male knockout mice. Li- Hawkins et al. (2000) concluded that the major physiologic role of Cyp7b1 is to inactivate oxysterols and that loss of this enzyme in the liver of mice is compensated for by an increase in the synthesis of bile acids by other pathways (see OMIM Ref. No. CYP39A1, 605994).

[14232] It is appreciated that the abovementioned animal model for CYP7B1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[14233] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14234] Li- Hawkins, J.; Lund, E. G.; Turley, S. D.; Russell, D. W. : Disruption of the oxysterol 7- alpha- hydroxylase gene in mice. J. Biol. Chem. 275: 16536- 16542, 2000. ; and

[14235] Setchell, K. D. R.; Schwarz, M.; O'Connell, N. C.; Lund, E. G.; Davis, D. L.; Lathe, R.; Thompson, H. R.; Tyson, R. W.; Sokol, R. J.; Russell, D. W. : Identification of a new inborn er.

[14236] Further studies establishing the function and utilities of CYP7B1 are found in John Hopkins OMIM database record ID 603711, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dna cross-link repair 1a (pso2 homolog, s. cerevisiae) (DCLRE1A, Accession NP_055696.1) is another GAM94 target gene, herein designated TARGET GENE. DCLRE1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DCLRE1A, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCLRE1A BINDING SITE, designated SEQ ID:13586, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14237] Another function of GAM94 is therefore inhibition of Dna cross-link repair 1a (pso2 homolog, s. cerevisiae) (DCLRE1A, Accession NP_055696.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCLRE1A.

[14238] Dopachrome tautomerase (dopachrome delta-isomerase, tyrosine-related protein 2) (DCT, Accession NP_001913.2) is another GAM94 target gene, herein designated TARGET GENE. DCT BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DCT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCT BINDING SITE, designated SEQ ID:12756, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14239] Another function of GAM94 is therefore inhibition of

Dopachrome tautomerase (dopachrome delta-isomerase, tyrosine-related protein 2) (DCT, Accession NP_001913.2), a gene which regulates eumelanin and phaeomelanin levels. and therefore may be associated with Melanoma. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Melanoma, and of other diseases and clinical conditions associated with DCT.

[14240] The function of DCT has been established by previous studies. Sturm et al. (1995) showed that the TYRP1 protein is encoded in 7 exons spread over 24 kb of genomic DNA. By contrast, the TYRP2 protein is encoded by 8 exons. TYRP1, TYRP2, and the tyrosinase gene share a common C- terminal membrane spanning exon. The position of in- tron junctions suggested that TYRP1 was derived from a TYR duplication and then was itself duplicated to give rise to the TYRP2 gene. The comparisons also suggested that at least some of the introns within the TYR, TYRP1, and TYRP2 coding regions were gained after duplication and that intron slippage was unlikely to have occurred. NYESO1 (CTAG; 300156) is expressed on tumor cells of many different types, including melanoma. TRP2 is a melanoma- differentiation antigen. In a melanoma vaccine

trial in patients with metastatic disease, Khong and Rosenberg (2002) identified tumor- infiltrating lymphocytes (TILs) that recognized NYESO1, TRP2, and a TRP2 splice variant from a patient who experienced dramatic tumor regression. The TILs expressed immunologic reactivity against these antigens before vaccination with antigens, none of which she had been vaccinated against. Khong and Rosenberg (2002) proposed that NYESO1 and TRP2 may be useful in the active immunotherapy of patients with melanoma.

[14241]

[14242] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14243] Khong, H. T.; Rosenberg, S. A. : Pre- existing immunity to tyrosinase- related protein (TRP)- 2, a new TRP- 2 isoform, and the NY- ESO- 1 melanoma antigen in a patient with a dramatic response to immunotherapy. J. Immun. 168: 951- 956, 2002. ; and

[14244] Sturm, R. A.; O'Sullivan B. J.; Box, N. F.; Smith, A. G.; Smit, S. E.; Puttick, E. R. J.; Parsons, P. G.; Dunn, I. S. : Chromosomal structure of the human TYRP1 and TYRP2 loci and compa.

[14245] Further studies establishing the function and utilities of DCT are found in John Hopkins OMIM database record ID 191275, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dead/h (asp-glu-ala-asp/his) box polypeptide 11 (chl1-like helicase homolog, s. cerevisiae) (DDX11, Accession NP_085913.1) is another GAM94 target gene, herein designated TARGET GENE. DDX11 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DDX11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DDX11 BINDING SITE, designated SEQ ID:14293, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14246] Another function of GAM94 is therefore inhibition of Dead/h (asp-glu-ala-asp/his) box polypeptide 11 (chl1-like helicase homolog, s. cerevisiae) (DDX11, Accession NP_085913.1), a gene which could be an ATP- dependent DNA- binding helicase and may intervene in cell cycle regulation. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with DDX11.

[14247] The function of DDX11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.DEPP (Accession NP_008952.1) is another GAM94 target gene, herein designated TARGET GENE. DEPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DEPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DEPP BINDING SITE, designated SEQ ID:12438, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14248] Another function of GAM94 is therefore inhibition of DEPP (Accession NP_008952.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEPP.

[14249] Desmin (DES, Accession NP_001918.2) is another GAM94 target gene, herein designated TARGET GENE. DES BINDING SITE1 and DES BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DES, corresponding to target binding sites such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DES BINDING SITE1 and DES BINDING SITE2, designated SEQ ID:5424 and SEQ ID:9797 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14250] Another function of GAM94 is therefore inhibition of Desmin (DES, Accession NP_001918.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DES.

[14251] Deiodinase, iodothyronine, type i (DIO1, Accession NP_000783.2) is another GAM94 target gene, herein designated TARGET GENE. DIO1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DIO1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DIO1 BINDING SITE, designated SEQ ID:5841, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14252] Another function of GAM94 is therefore inhibition of Deiodinase, iodothyronine, type i (DIO1, Accession

NP_000783.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO1.

[14253] DJ102H19.4 (Accession NP_071367.1) is another GAM94 target gene, herein designated TARGET GENE. DJ102H19.4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DJ102H19.4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DJ102H19.4 BINDING SITE, designated SEQ ID:13535, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14254] Another function of GAM94 is therefore inhibition of DJ102H19.4 (Accession NP_071367.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ102H19.4.

[14255] DKFZP434A0225 (Accession XP_168185.1) is another GAM94 target gene, herein designated TARGET GENE. DKFZP434A0225 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434A0225, corresponding to a target binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434A0225 BINDING SITE, designated SEQ ID:14982, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14256] Another function of GAM94 is therefore inhibition of DKFZP434A0225 (Accession XP_168185.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434A0225.

[14257] DKFZP434L187 (Accession XP_044070.6) is another GAM94 target gene, herein designated TARGET GENE. DKFZP434L187 BINDING SITE1 and DKFZP434L187 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DKFZP434L187, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434L187 BINDING SITE1 and DKFZP434L187 BINDING SITE2, designated SEQ ID:8955 and SEQ ID:4715 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14258] Another function of GAM94 is therefore inhibition of DKFZP434L187 (Accession XP_044070.6) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L187.

[14259] DKFZp451A175 (Accession NP_694967.1) is another GAM94 target gene, herein designated TARGET GENE. DKFZp451A175 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp451A175, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp451A175 BINDING SITE, designated SEQ ID:18054, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14260] Another function of GAM94 is therefore inhibition of DKFZp451A175 (Accession NP_694967.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp451A175.

[14261] DKFZp547G183 (Accession NP_061175.1) is another GAM94 target gene, herein designated TARGET GENE. DK-

FZp547G183 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp547G183, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547G183 BINDING SITE, designated SEQ ID:1986, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14262] Another function of GAM94 is therefore inhibition of DKFZp547G183 (Accession NP_061175.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547G183.

[14263] DKFZp564I1922 (Accession NP_056234.1) is another GAM94 target gene, herein designated TARGET GENE. DKFZp564I1922 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp564I1922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp564I1922 BINDING SITE, designated SEQ ID:18835, to the nucleotide sequence of

GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14264] Another function of GAM94 is therefore inhibition of DKFZp564I1922 (Accession NP_056234.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp564I1922.

[14265] DKFZp761O17121 (Accession NP_115663.1) is another GAM94 target gene, herein designated TARGET GENE. DKFZp761O17121 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761O17121, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761O17121 BINDING SITE, designated SEQ ID:14715, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14266] Another function of GAM94 is therefore inhibition of DKFZp761O17121 (Accession NP_115663.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761O17121.

[14267] Dickkopf homolog 2 (xenopus laevis) (DKK2, Accession NP_055236.1) is another GAM94 target gene, herein designated TARGET GENE. DKK2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKK2 BINDING SITE, designated SEQ ID:8609, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14268] Another function of GAM94 is therefore inhibition of Dickkopf homolog 2 (xenopus laevis) (DKK2, Accession NP_055236.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK2.

[14269] Distal-less homeo box 1 (DLX1, Accession NP_835221.1) is another GAM94 target gene, herein designated TARGET GENE. DLX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DLX1 BINDING SITE, designated SEQ ID:12176,

to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14270] Another function of GAM94 is therefore inhibition of Distal-less homeo box 1 (DLX1, Accession NP_835221.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLX1.

[14271] Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004006.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14272] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004006.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystro-

phy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14273] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004012.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14274] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004012.1), a gene which muscular dystrophy . and therefore is associated with Duchenne

muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14275] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004009.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14276] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004009.1), a gene which muscular

dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14277] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004011.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14278] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types)

(DMD, Accession NP_004011.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14279] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004008.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14280] Another function of GAM94 is therefore inhibition of Dys-

trophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004008.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14281] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004000.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14282] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004000.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14283] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004001.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated

SEQ ID:332.

[14284] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004001.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14285] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004007.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of

GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14286] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004007.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14287] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004005.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14288] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004005.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other

diseases and clinical conditions associated with DMD.

[14289] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004004.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14290] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004004.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystro-

phy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14291] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_000100.2) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14292] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_000100.2), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis,

prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14293] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_003997.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14294] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_003997.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystro-

phy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14295] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004002.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14296] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004002.1), a gene which muscular dystrophy . and therefore is associated with Duchenne

muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14297] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004003.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14298] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004003.1), a gene which muscular

dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14299] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_003998.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14300] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types)

(DMD, Accession NP_003998.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14301] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004014.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14302] Another function of GAM94 is therefore inhibition of Dys-

trophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004014.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14303] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004013.1) is another GAM94 target gene, herein designated TARGET GENE. DMD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14304] Another function of GAM94 is therefore inhibition of Dystrophin (muscular dystrophy, duchenne and becker types) (DMD, Accession NP_004013.1), a gene which muscular dystrophy . and therefore is associated with Duchenne muscular dystrophy (dmd) and becker muscular dystrophy. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Duchenne muscular dystrophy (dmd) and becker muscular dystrophy, and of other diseases and clinical conditions associated with DMD.

[14305] The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Dnaj (hsp40) homolog, subfamily a, member 1 (DNAJA1, Accession NP_001530.1) is another GAM94 target gene, herein designated TARGET GENE. DNAJA1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DNAJA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNAJA1 BINDING SITE, designated SEQ ID:9846, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14306] Another function of GAM94 is therefore inhibition of Dnaj (hsp40) homolog, subfamily a, member 1 (DNAJA1, Accession NP_001530.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJA1.

[14307] Dnaj (hsp40) homolog, subfamily b, member 5 (DNAJB5, Accession NP_036398.2) is another GAM94 target gene, herein designated TARGET GENE. DNAJB5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DNAJB5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNAJB5 BINDING SITE, designated SEQ ID:17549, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14308] Another function of GAM94 is therefore inhibition of Dnaj (hsp40) homolog, subfamily b, member 5 (DNAJB5, Accession NP_036398.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJB5.

[14309] DNAM-1 (Accession NP_006557.1) is another GAM94 target gene, herein designated TARGET GENE. DNAM-1

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DNAM-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNAM-1 BINDING SITE, designated SEQ ID:2229, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14310] Another function of GAM94 is therefore inhibition of DNAM-1 (Accession NP_006557.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAM-1.

[14311] DPF3 (Accession NP_036206.1) is another GAM94 target gene, herein designated TARGET GENE. DPF3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DPF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DPF3 BINDING SITE, designated SEQ ID:16598, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14312] Another function of GAM94 is therefore inhibition of DPF3

(Accession NP_036206.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPF3.

[14313] Dihydropyrimidinase-like 3 (DPYSL3, Accession NP_001378.1) is another GAM94 target gene, herein designated TARGET GENE. DPYSL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DPYSL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DPYSL3 BINDING SITE, designated SEQ ID:13744, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14314] Another function of GAM94 is therefore inhibition of Dihydropyrimidinase-like 3 (DPYSL3, Accession NP_001378.1), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL3.

[14315] The function of DPYSL3 has been established by previous studies. Hamajima et al. (1996) isolated a cDNA encoding dihydropyrimidinase- like 3 (OMIM Ref. No. DPYSL3),

called DRP3 by them, from a fetal brain cDNA library (see OMIM Ref. No. 222748). By Northern blot analysis of adult human tissues, they detected a 5.8- kb DPYSL3 transcript at high levels in heart and skeletal muscle and at low levels in brain and lung. Gaetano et al. (1997) isolated a human ULIP cDNA from retinoic acid- differentiated neuroblastoma cells. In contrast to Hamajima et al. (1996), they found that the gene is expressed strongly in human fetal brain and spinal cord but is not detectably expressed in adult brain and nonneuronal tissues. The 5.5- kb full-length cDNA contains a 1,710- bp open reading frame predicting a 570- amino acid protein. The human gene shares 98% identity with mouse Ulip. The authors speculated that the human ULIP gene mediates signals involved in axonal growth.

[14316]

[14317] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14318] Hamajima, N.; Matsuda, K.; Sakata, S.; Tamaki, N.; Sasaki, M.; Nonaka, M. : A novel gene family defined by human dihydropyrimidinase and three related proteins with differential tissue distribution. Gene 180: 157- 163, 1996. ;

and

[14319] Gaetano, C; Matsuo, T.; Thiele, C. J. : Identification and characterization of a retinoic acid- regulated human homologue of the unc- 33- like phosphoprotein gene (hUlip) from neuroblastom.

[14320] Further studies establishing the function and utilities of DPYSL3 are found in John Hopkins OMIM database record ID 601168, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dopamine receptor d3 (DRD3, Accession NP_387507.1) is another GAM94 target gene, herein designated TARGET GENE. DRD3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DRD3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DRD3 BINDING SITE, designated SEQ ID:11135, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14321] Another function of GAM94 is therefore inhibition of Dopamine receptor d3 (DRD3, Accession NP_387507.1), a gene which is mediated by g proteins which inhibit adenylyl cyclase. Accordingly, utilities of GAM94 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with DRD3.

[14322] The function of DRD3 has been established by previous studies. Sokoloff et al. (1990) characterized a dopamine receptor that differs in its pharmacology and signaling system from the D1 (OMIM Ref. No. 126449) and D2 (OMIM Ref. No. 126450) receptors and represents both an autoreceptor and a postsynaptic receptor. Designated the dopamine receptor D3, it is localized to limbic areas of the brain, which are associated with cognitive, emotional, and endocrine functions. It appeared to mediate some of the effects of antipsychotic drugs and drugs used in the treatment of Parkinson disease (OMIM Ref. No. 168600), which were previously thought to interact only with D2 receptors. By screening cDNA and genomic libraries using a combination of reverse transcription and PCR, Sokoloff et al. (1990) cloned the DRD3 gene. Like the DRD2 gene, but unlike most other members of this superfamily, the DRD3 gene contains introns, 5 in number. The position of 2 of the introns corresponds to that of introns in DRD2. Le Coniat et al. (1991) assigned the DRD3 gene to chromosome 3 by hybridization of a genomic probe to flow- sorted chromosomes and localized it to band 3q13.3 by in situ

hybridization.

[14323] Animal model experiments lend further support to the function of DRD3. The role of the D3 receptor is difficult to study because of its low abundance (approximately 1% of D2 receptors) and the absence of selective ligands. Using a strategy of gene targeting in mouse embryonic stem cells, Accili et al. (1996) generated DRD3- deficient mice carrying a premature chain- termination mutation after residue arginine 148. Binding of the dopamine antagonist iodosulpride to D3 receptors was absent in mice homozygous for the mutation and greatly reduced in heterozygous mice. Behavioral analysis of mutant mice showed that this mutation is associated with hyperactivity. Homozygous mice lacking D3 receptors displayed increased locomotor activity and rearing behavior. Mice heterozygous for the mutation showed similar, although less pronounced, behavioral alterations.

[14324] It is appreciated that the abovementioned animal model for DRD3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[14325] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[14326] Accili, D.; Fishburn, C. S.; Drago, J.; Steiner, H.; Lachowicz, J. E.; Park, B.- H.; Gauda, E. B.; Lee, E. J.; Cool, M. H.; Sibley, D. R.; Gerfen, C. R.; Westphal, H.; Fuchs, S. : A targeted mutation of the D3 dopamine receptor gene is associated with hyperactivity in mice. Proc. Nat. Acad. Sci. 93: 1945- 1949, 1996. ; and

[14327] Sokoloff, P.; Giros, B.; Martres, M.- P.; Bouthenet, M.- L.; Schwartz, J.- C. : Molecular cloning and characterization of a novel dopamine receptor (D- 3) as a target for neuroleptics. Nat.

[14328] Further studies establishing the function and utilities of DRD3 are found in John Hopkins OMIM database record ID 126451, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dual specificity phosphatase 16 (DUSP16, Accession XP_039106.1) is another GAM94 target gene, herein designated TARGET GENE. DUSP16 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DUSP16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DUSP16 BINDING SITE, designated

SEQ ID:7912, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14329] Another function of GAM94 is therefore inhibition of Dual specificity phosphatase 16 (DUSP16, Accession XP_039106.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP16.

[14330] Early growth response 1 (EGR1, Accession NP_001955.1) is another GAM94 target gene, herein designated TARGET GENE. EGR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EGR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EGR1 BINDING SITE, designated SEQ ID:2968, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14331] Another function of GAM94 is therefore inhibition of Early growth response 1 (EGR1, Accession NP_001955.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR1.

[14332] Eukaryotic translation initiation factor 4 gamma, 3

(EIF4G3, Accession NP_003751.2) is another GAM94 target gene, herein designated TARGET GENE. EIF4G3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EIF4G3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EIF4G3 BINDING SITE, designated SEQ ID:12862, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14333] Another function of GAM94 is therefore inhibition of Eukaryotic translation initiation factor 4 gamma, 3 (EIF4G3, Accession NP_003751.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF4G3.

[14334] Eukaryotic translation initiation factor 5a (EIF5A, Accession NP_001961.1) is another GAM94 target gene, herein designated TARGET GENE. EIF5A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EIF5A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EIF5A BINDING SITE, designated

SEQ ID:3210, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14335] Another function of GAM94 is therefore inhibition of Eukaryotic translation initiation factor 5a (EIF5A, Accession NP_001961.1), a gene which is an initiation factor. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF5A.

[14336] The function of EIF5A has been established by previous studies. The eukaryotic initiation factor 5A is an 18- kD protein composed of 154 amino acids. It contains a unique amino acid residue, hypusine, that is formed post-translationally via the transfer and hydroxylation of the butylamino- group from the polyamine spermidine to a lys50 within the EIF5A protein. Koettnitz et al. (1994) isolated and characterized the human EIF5A pseudogene. Subsequently, Koettnitz et al. (1995) identified a genomic clone with an EIF5A containing 3 introns and spanning about 4.8 kb. The authors showed that this sequence would successfully complement yeast carrying the HYP2 mutation (the homolog of EIF5A), whereas the pseudogenes could not. Steinkasserer et al. (1995) mapped the EIF5A gene to 17p13- p12 by fluorescence in situ hy-

bridization. Three pseudogenes were mapped to 10q23.3, 17q25, and 19q13.2.

[14337]

[14338] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14339] Koettnitz, K.; Wohl, T.; Kappel, B.; Lottspeich, F.; Hauber, J.; Bevec, D. : Identification of a new member of the human eIF- 5A gene family. Gene 159: 283- 284, 1995. ; and

[14340] Steinkasserer, A.; Jones, T.; Sheer, D.; Koettnitz, K.; Hauber, J.; Bevec, D. : The eukaryotic cofactor for the human immunodeficiency virus type 1 (HIV- 1) rev protein, eIF- 5A, maps to.

[14341] Further studies establishing the function and utilities of EIF5A are found in John Hopkins OMIM database record ID 600187, and in cited publications listed in Table 5, which are hereby incorporated by reference.Eukaryotic translation initiation factor 5a pseudogene 1 (EIF5AP1, Accession XP_290186.1) is another GAM94 target gene, herein designated TARGET GENE. EIF5AP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EIF5AP1, corresponding to a target binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EIF5AP1 BINDING SITE, designated SEQ ID:6926, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14342] Another function of GAM94 is therefore inhibition of Eukaryotic translation initiation factor 5a pseudogene 1 (EIF5AP1, Accession XP_290186.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF5AP1.

[14343] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_038475.2) is another GAM94 target gene, herein designated TARGET GENE. EMR2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EMR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE, designated SEQ ID:9659, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14344] Another function of GAM94 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_038475.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR2.

[14345] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690884.1) is another GAM94 target gene, herein designated TARGET GENE. EMR2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EMR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE, designated SEQ ID:9659, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14346] Another function of GAM94 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690884.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with EMR2.

[14347] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690880.1) is another GAM94 target gene, herein designated TARGET GENE. EMR2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EMR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE, designated SEQ ID:9659, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14348] Another function of GAM94 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690880.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR2.

[14349] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690882.1) is another GAM94 target gene, herein designated TARGET GENE. EMR2 BINDING SITE is a target binding site found in

the 3` untranslated region of multiple transcripts of mRNA encoded by EMR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE, designated SEQ ID:9659, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14350] Another function of GAM94 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690882.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR2.

[14351] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690883.1) is another GAM94 target gene, herein designated TARGET GENE. EMR2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EMR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE,

designated SEQ ID:9659, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14352] Another function of GAM94 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690883.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR2.

[14353] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690885.1) is another GAM94 target gene, herein designated TARGET GENE. EMR2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EMR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE, designated SEQ ID:9659, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14354] Another function of GAM94 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-

like sequence 2 (EMR2, Accession NP_690885.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR2.

[14355] Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690881.1) is another GAM94 target gene, herein designated TARGET GENE. EMR2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EMR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMR2 BINDING SITE, designated SEQ ID:9659, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14356] Another function of GAM94 is therefore inhibition of Egf-like module containing, mucin-like, hormone receptor-like sequence 2 (EMR2, Accession NP_690881.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMR2.

[14357] Erythrocyte membrane protein band 4.1-like 1 (EPB41L1,

Accession NP_818932.1) is another GAM94 target gene, herein designated TARGET GENE. EPB41L1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by EPB41L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPB41L1 BINDING SITE, designated SEQ ID:16125, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14358] Another function of GAM94 is therefore inhibition of Erythrocyte membrane protein band 4.1-like 1 (EPB41L1, Accession NP_818932.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L1.

[14359] ESDN (Accession NP_563615.2) is another GAM94 target gene, herein designated TARGET GENE. ESDN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ESDN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ESDN BINDING SITE, designated SEQ ID:551, to the nucleotide se-

quence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14360] Another function of GAM94 is therefore inhibition of ESDN (Accession NP_563615.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESDN.

[14361] Ecotropic viral integration site 5 (EVI5, Accession NP_005656.2) is another GAM94 target gene, herein designated TARGET GENE. EVI5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EVI5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:9673, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14362] Another function of GAM94 is therefore inhibition of Ecotropic viral integration site 5 (EVI5, Accession NP_005656.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5.

[14363] Exostoses (multiple) 1 (EXT1, Accession NP_000118.1) is another GAM94 target gene, herein designated TARGET

GENE. EXT1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by EXT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EXT1 BINDING SITE, designated SEQ ID:16470, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14364] Another function of GAM94 is therefore inhibition of Exostoses (multiple) 1 (EXT1, Accession NP_000118.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXT1.

[14365] Fatty-acid-coenzyme a ligase, long-chain 4 (FACL4, Accession NP_075266.1) is another GAM94 target gene, herein designated TARGET GENE. FACL4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FACL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FACL4 BINDING SITE, designated SEQ ID:4716, to the nucleotide sequence of GAM94 RNA, herein designated GAM

RNA, also designated SEQ ID:332.

[14366] Another function of GAM94 is therefore inhibition of Fatty-acid-coenzyme a ligase, long-chain 4 (FACL4, Accession NP_075266.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL4.

[14367] Fatty-acid-coenzyme a ligase, long-chain 4 (FACL4, Accession NP_004449.1) is another GAM94 target gene, herein designated TARGET GENE. FACL4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FACL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FACL4 BINDING SITE, designated SEQ ID:4716, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14368] Another function of GAM94 is therefore inhibition of Fatty-acid-coenzyme a ligase, long-chain 4 (FACL4, Accession NP_004449.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL4.

[14369] Fibroblast growth factor 13 (FGF13, Accession

NP_004105.1) is another GAM94 target gene, herein designated TARGET GENE. FGF13 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by FGF13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGF13 BINDING SITE, designated SEQ ID:4855, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14370] Another function of GAM94 is therefore inhibition of Fibroblast growth factor 13 (FGF13, Accession NP_004105.1), a gene which probably involved in nervous system development and function. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF13.

[14371] The function of FGF13 has been established by previous studies. See fibroblast growth factor- 12 (FGF12; 601513). By Southern blot hybridization of genomic DNA from rodent/human hybrid cell lines carrying individual human chromosomes, Smallwood et al. (1996) mapped the FHF2 gene (also symbolized FGF13) to the X chromosome. By using an interspecific backcross mapping panel,

they demonstrated that the mouse gene, Fhf2, shows no recombination with the gene for CD40 antigen ligand (OMIM Ref. No. 300386). Thus the human gene is probably located at Xq26. By use of isotopic in situ hybridization, Lovec et al. (1997) assigned the FHF2 gene to Xq21. Gecz et al. (1999), however, provided evidence that the FHF2 gene is located in Xq26.3. They identified a male patient with features of Borjeson- Forssman- Lehmann syndrome (BFLS; 301900) and a duplication of the Xq26-q28 region. By FISH using YAC clones from Xq26, they localized the duplication breakpoint to an interval of approximately 400 kb in the Xq26.3 region between DXS155 and DXS294/DXS730. Database searches and an analysis of available genomic sequence from the region showed that the FHF2 gene is located within the duplication breakpoint interval. Gecz et al. (1999) determined the structure of the FHF2 gene and identified 2 new exons, including a new 5- prime end exon, designated 1B. FHF2 is a large gene, extending over approximately 200 kb in Xq26.3, and contains at least 7 exons. It shows tissue-specific alternative splicing and alternative transcription starts. Northern blot hybridization showed highest expression in brain and skeletal muscle. The localization and

tissue- specific expression pattern of FHF2 made it a possible candidate gene for familial cases of BFLS and for other syndromal and nonspecific forms of X- linked mental retardation mapping to that region.

[14372]

[14373] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14374] Gecz, J.; Baker, E.; Donnelly, A.; Ming, J. E.; McDonald-McGinn, D. M.; Spinner, N. B.; Zackai, E. H.; Sutherland, G. R.; Mulley, J. C. : Fibroblast growth factor homologous factor 2 (FHF2): gene structure, expression and mapping to the Borjeson- Forssman- Lehmann syndrome region in Xq26 delineated by a duplication breakpoint in a BFLS-like patient. Hum. Genet. 104: 56- 63, 1999. ; and

[14375] Lovec, H.; Hartung, H.; Verdier, A.- S.; Mattei, M.- G.; Birnbaum, D.; Goldfarb, M.; Coulier, F. : Assignment of FGF13 to human chromosome band Xq21 by in situ hybridization. Cytogenet.

[14376] Further studies establishing the function and utilities of FGF13 are found in John Hopkins OMIM database record ID 300070, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fk506 binding

protein 10, 65 kda (FKBP10, Accession NP_068758.2) is another GAM94 target gene, herein designated TARGET GENE. FKBP10 BINDING SITE1 and FKBP10 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FKBP10, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FKBP10 BINDING SITE1 and FKBP10 BINDING SITE2, designated SEQ ID:13573 and SEQ ID:4046 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14377] Another function of GAM94 is therefore inhibition of Fk506 binding protein 10, 65 kda (FKBP10, Accession NP_068758.2), a gene which ppiases accelerate the folding of proteins during protein synthesis. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP10.

[14378] The function of FKBP10 has been established by previous studies. The FK506- binding proteins (FKBPs) were first identified as receptors for the immunosuppressants FK506 and rapamycin. All FKBPs display peptidyl- prolyl

cis/trans isomerase (OMIM Ref. No. PPIase) activity and act as molecular chaperones. Patterson et al. (2000) found that mouse Fkbp10 is contained within the lumen of the endoplasmic reticulum. Western blot analysis detected expression in 12- day- old mouse aorta, brain, kidney, and lung; no or barely detectable expression was found in adult tissues. Immunolocalization of Fkbp10 in developing lung revealed staining of vascular and airway smooth muscle cells. Patterson et al. (2002) stated that the human and mouse protein sequences are identical with the exception of a valine- 24 addition within the signal sequence of the human protein. Both contain 4 consecutive PPIase domains. Patterson et al. (2002) determined that both the human and mouse FKBP10 genes contain 10 exons. The International Radiation Hybrid Mapping Consortium mapped the FKBP10 gene to chromosome 17 (stSG35365).

[14379]

[14380] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14381] Patterson, C. E.; Gao, J.; Rooney, A. P.; Davis, E. C. : Genomic organization of mouse and human 65 kDa FK506-

binding protein genes and evolution of the FKBP multi-gene family. Genomics 79: 881- 889, 2002. ; and

[14382] Patterson, C. E.; Schaub, T.; Coleman, E. J.; Davis, E. C. : Developmental regulation of FKBP65: an ER localized extracellular matrix- binding protein. Molec. Biol. Cell 11: 3925- 3935.

[14383] Further studies establishing the function and utilities of FKBP10 are found in John Hopkins OMIM database record ID 607063, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fk506 binding protein 8, 38kda (FKBP8, Accession NP_036313.2) is another GAM94 target gene, herein designated TARGET GENE. FKBP8 BINDING SITE1 and FKBP8 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FKBP8, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FKBP8 BINDING SITE1 and FKBP8 BINDING SITE2, designated SEQ ID:10546 and SEQ ID:10823 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14384] Another function of GAM94 is therefore inhibition of

Fk506 binding protein 8, 38kda (FKBP8, Accession NP_036313.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP8.

[14385] FLJ10300 (Accession NP_060521.2) is another GAM94 target gene, herein designated TARGET GENE. FLJ10300 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ10300, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10300 BINDING SITE, designated SEQ ID:18087, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14386] Another function of GAM94 is therefore inhibition of FLJ10300 (Accession NP_060521.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10300.

[14387] FLJ10415 (Accession NP_060559.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ10415 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10415, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10415 BINDING SITE, designated SEQ ID:15496, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14388] Another function of GAM94 is therefore inhibition of FLJ10415 (Accession NP_060559.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10415.

[14389] FLJ10891 (Accession NP_060730.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ10891 BINDING SITE1 and FLJ10891 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ10891, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10891 BINDING SITE1 and FLJ10891 BINDING SITE2, designated SEQ ID:18909 and SEQ ID:10943 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14390] Another function of GAM94 is therefore inhibition of FLJ10891 (Accession NP_060730.1) . Accordingly, utilities

of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10891.

[14391] FLJ10997 (Accession NP_060763.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ10997 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10997, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10997 BINDING SITE, designated SEQ ID:14334, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14392] Another function of GAM94 is therefore inhibition of FLJ10997 (Accession NP_060763.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10997.

[14393] FLJ11016 (Accession NP_060771.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ11016 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11016, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ11016 BINDING SITE, designated SEQ ID:15194, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14394] Another function of GAM94 is therefore inhibition of FLJ11016 (Accession NP_060771.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11016.

[14395] FLJ11021 (Accession NP_075388.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ11021 BINDING SITE1 and FLJ11021 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ11021, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11021 BINDING SITE1 and FLJ11021 BINDING SITE2, designated SEQ ID:11805 and SEQ ID:19145 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14396] Another function of GAM94 is therefore inhibition of FLJ11021 (Accession NP_075388.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11021.

[14397] FLJ11191 (Accession NP_060825.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ11191 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ11191, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11191 BINDING SITE, designated SEQ ID:19798, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14398] Another function of GAM94 is therefore inhibition of FLJ11191 (Accession NP_060825.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11191.

[14399] FLJ11700 (Accession NP_079168.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ11700 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11700, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11700 BINDING SITE, designated SEQ ID:15002, to the nucleotide sequence of GAM94 RNA, herein designated

GAM RNA, also designated SEQ ID:332.

[14400] Another function of GAM94 is therefore inhibition of FLJ11700 (Accession NP_079168.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11700.

[14401] FLJ11756 (Accession NP_078882.2) is another GAM94 target gene, herein designated TARGET GENE. FLJ11756 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ11756, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11756 BINDING SITE, designated SEQ ID:6613, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14402] Another function of GAM94 is therefore inhibition of FLJ11756 (Accession NP_078882.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11756.

[14403] FLJ12528 (Accession NP_079426.2) is another GAM94 target gene, herein designated TARGET GENE. FLJ12528 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12528, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12528 BINDING SITE, designated SEQ ID:3405, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14404] Another function of GAM94 is therefore inhibition of FLJ12528 (Accession NP_079426.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12528.

[14405] FLJ12700 (Accession NP_079186.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ12700 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12700, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12700 BINDING SITE, designated SEQ ID:4392, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14406] Another function of GAM94 is therefore inhibition of FLJ12700 (Accession NP_079186.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ12700.

[14407] FLJ12704 (Accession NP_079274.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ12704 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ12704, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12704 BINDING SITE, designated SEQ ID:13847, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14408] Another function of GAM94 is therefore inhibition of FLJ12704 (Accession NP_079274.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12704.

[14409] FLJ13111 (Accession NP_079358.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ13111 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13111, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13111 BINDING SITE, designated SEQ ID:2017, to the

nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14410] Another function of GAM94 is therefore inhibition of FLJ13111 (Accession NP_079358.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13111.

[14411] FLJ13769 (Accession NP_079288.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ13769 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13769, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13769 BINDING SITE, designated SEQ ID:5258, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14412] Another function of GAM94 is therefore inhibition of FLJ13769 (Accession NP_079288.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13769.

[14413] FLJ13841 (Accession NP_078978.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ13841 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by FLJ13841, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13841 BINDING SITE, designated SEQ ID:15346, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14414] Another function of GAM94 is therefore inhibition of FLJ13841 (Accession NP_078978.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13841.

[14415] FLJ14566 (Accession NP_116195.2) is another GAM94 target gene, herein designated TARGET GENE. FLJ14566 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14566, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14566 BINDING SITE, designated SEQ ID:5288, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14416] Another function of GAM94 is therefore inhibition of FLJ14566 (Accession NP_116195.2) . Accordingly, utilities

of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14566.

[14417] FLJ14957 (Accession NP_116255.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ14957 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14957, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14957 BINDING SITE, designated SEQ ID:4961, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14418] Another function of GAM94 is therefore inhibition of FLJ14957 (Accession NP_116255.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14957.

[14419] FLJ20232 (Accession NP_061881.2) is another GAM94 target gene, herein designated TARGET GENE. FLJ20232 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20232, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ20232 BINDING SITE, designated SEQ ID:17592, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14420] Another function of GAM94 is therefore inhibition of FLJ20232 (Accession NP_061881.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20232.

[14421] FLJ20273 (Accession NP_061900.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ20273 BINDING SITE1 and FLJ20273 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ20273, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20273 BINDING SITE1 and FLJ20273 BINDING SITE2, designated SEQ ID:17100 and SEQ ID:10073 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14422] Another function of GAM94 is therefore inhibition of FLJ20273 (Accession NP_061900.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20273.

[14423] FLJ20668 (Accession NP_060393.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ20668 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20668, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20668 BINDING SITE, designated SEQ ID:10920, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14424] Another function of GAM94 is therefore inhibition of FLJ20668 (Accession NP_060393.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20668.

[14425] FLJ21159 (Accession NP_079102.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ21159 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21159, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21159 BINDING SITE, designated SEQ ID:19392, to the nucleotide sequence of GAM94 RNA, herein designated

GAM RNA, also designated SEQ ID:332.

[14426] Another function of GAM94 is therefore inhibition of FLJ21159 (Accession NP_079102.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21159.

[14427] FLJ21940 (Accession NP_073739.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ21940 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21940, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21940 BINDING SITE, designated SEQ ID:2403, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14428] Another function of GAM94 is therefore inhibition of FLJ21940 (Accession NP_073739.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21940.

[14429] FLJ21986 (Accession NP_079189.3) is another GAM94 target gene, herein designated TARGET GENE. FLJ21986 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ21986, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21986 BINDING SITE, designated SEQ ID:6727, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14430] Another function of GAM94 is therefore inhibition of FLJ21986 (Accession NP_079189.3) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21986.

[14431] FLJ22037 (Accession XP_168215.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ22037 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22037, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22037 BINDING SITE, designated SEQ ID:10902, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14432] Another function of GAM94 is therefore inhibition of FLJ22037 (Accession XP_168215.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ22037.

[14433] FLJ22774 (Accession NP_115605.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ22774 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22774, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22774 BINDING SITE, designated SEQ ID:10317, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14434] Another function of GAM94 is therefore inhibition of FLJ22774 (Accession NP_115605.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22774.

[14435] FLJ25369 (Accession NP_689883.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ25369 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ25369, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ25369 BINDING SITE, designated SEQ ID:14188, to the

nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14436] Another function of GAM94 is therefore inhibition of FLJ25369 (Accession NP_689883.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25369.

[14437] FLJ25438 (Accession NP_653297.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ25438 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ25438, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ25438 BINDING SITE, designated SEQ ID:12072, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14438] Another function of GAM94 is therefore inhibition of FLJ25438 (Accession NP_653297.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25438.

[14439] FLJ31131 (Accession NP_689748.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ31131 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ31131, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31131 BINDING SITE, designated SEQ ID:13536, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14440] Another function of GAM94 is therefore inhibition of FLJ31131 (Accession NP_689748.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31131.

[14441] FLJ31659 (Accession NP_694572.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ31659 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31659, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31659 BINDING SITE, designated SEQ ID:2343, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14442] Another function of GAM94 is therefore inhibition of FLJ31659 (Accession NP_694572.1) . Accordingly, utilities

of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31659.

[14443] FLJ32063 (Accession NP_694576.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ32063 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32063, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32063 BINDING SITE, designated SEQ ID:8368, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14444] Another function of GAM94 is therefore inhibition of FLJ32063 (Accession NP_694576.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32063.

[14445] FLJ32203 (Accession NP_653232.2) is another GAM94 target gene, herein designated TARGET GENE. FLJ32203 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ32203, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ32203 BINDING SITE, designated SEQ ID:17014, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14446] Another function of GAM94 is therefore inhibition of FLJ32203 (Accession NP_653232.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32203.

[14447] FLJ32894 (Accession NP_653268.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ32894 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32894, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32894 BINDING SITE, designated SEQ ID:6669, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14448] Another function of GAM94 is therefore inhibition of FLJ32894 (Accession NP_653268.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32894.

[14449] FLJ33610 (Accession NP_775968.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ33610

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ33610, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33610 BINDING SITE, designated SEQ ID:18380, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14450] Another function of GAM94 is therefore inhibition of FLJ33610 (Accession NP_775968.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33610.

[14451] FLJ33887 (Accession NP_775756.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ33887 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ33887, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33887 BINDING SITE, designated SEQ ID:8829, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14452] Another function of GAM94 is therefore inhibition of

FLJ33887 (Accession NP_775756.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33887.

[14453] FLJ34278 (Accession NP_775873.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ34278 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ34278, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34278 BINDING SITE, designated SEQ ID:8967, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14454] Another function of GAM94 is therefore inhibition of FLJ34278 (Accession NP_775873.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34278.

[14455] FLJ35721 (Accession NP_775955.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ35721 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ35721, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ35721 BINDING SITE, designated SEQ ID:7540, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14456] Another function of GAM94 is therefore inhibition of FLJ35721 (Accession NP_775955.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35721.

[14457] FLJ35785 (Accession NP_775884.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ35785 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ35785, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35785 BINDING SITE, designated SEQ ID:6827, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14458] Another function of GAM94 is therefore inhibition of FLJ35785 (Accession NP_775884.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35785.

[14459] FLJ35866 (Accession XP_300990.1) is another GAM94 tar-

get gene, herein designated TARGET GENE. FLJ35866 BINDING SITE1 and FLJ35866 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by FLJ35866, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35866 BINDING SITE1 and FLJ35866 BINDING SITE2, designated SEQ ID:4640 and SEQ ID:6770 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14460] Another function of GAM94 is therefore inhibition of FLJ35866 (Accession XP_300990.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35866.

[14461] FLJ36006 (Accession NP_689858.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ36006 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ36006, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ36006 BINDING SITE, designated SEQ ID:18215, to the

nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14462] Another function of GAM94 is therefore inhibition of FLJ36006 (Accession NP_689858.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36006.

[14463] FLJ36870 (Accession NP_775929.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ36870 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ36870, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ36870 BINDING SITE, designated SEQ ID:15135, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14464] Another function of GAM94 is therefore inhibition of FLJ36870 (Accession NP_775929.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ36870.

[14465] FLJ37045 (Accession NP_787085.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ37045 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ37045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ37045 BINDING SITE, designated SEQ ID:3394, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14466] Another function of GAM94 is therefore inhibition of FLJ37045 (Accession NP_787085.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ37045.

[14467] FLJ37306 (Accession NP_775768.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ37306 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ37306, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ37306 BINDING SITE, designated SEQ ID:17101, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14468] Another function of GAM94 is therefore inhibition of FLJ37306 (Accession NP_775768.1) . Accordingly, utilities

of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ37306.

[14469] FLJ38568 (Accession NP_694984.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ38568 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38568, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38568 BINDING SITE, designated SEQ ID:18616, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14470] Another function of GAM94 is therefore inhibition of FLJ38568 (Accession NP_694984.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38568.

[14471] FLJ39005 (Accession NP_848616.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ39005 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ39005, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ39005 BINDING SITE, designated SEQ ID:911, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14472] Another function of GAM94 is therefore inhibition of FLJ39005 (Accession NP_848616.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39005.

[14473] FLJ39061 (Accession XP_092342.3) is another GAM94 target gene, herein designated TARGET GENE. FLJ39061 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ39061, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39061 BINDING SITE, designated SEQ ID:17919, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14474] Another function of GAM94 is therefore inhibition of FLJ39061 (Accession XP_092342.3) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39061.

[14475] FLJ39421 (Accession NP_848614.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ39421

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ39421, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39421 BINDING SITE, designated SEQ ID:11838, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14476] Another function of GAM94 is therefore inhibition of FLJ39421 (Accession NP_848614.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39421.

[14477] FLJ40473 (Accession NP_848626.1) is another GAM94 target gene, herein designated TARGET GENE. FLJ40473 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ40473, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ40473 BINDING SITE, designated SEQ ID:4047, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14478] Another function of GAM94 is therefore inhibition of

FLJ40473 (Accession NP_848626.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ40473.

[14479] Fms-related tyrosine kinase 4 (FLT4, Accession NP_002011.1) is another GAM94 target gene, herein designated TARGET GENE. FLT4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLT4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLT4 BINDING SITE, designated SEQ ID:15512, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14480] Another function of GAM94 is therefore inhibition of Fms-related tyrosine kinase 4 (FLT4, Accession NP_002011.1), a gene which receptor for vegf- c. has a tyrosine- protein kinase activity. and therefore is associated with Lymphedema . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Lymphedema ., and of other diseases and clinical conditions associated with FLT4.

[14481] The function of FLT4 has been established by previous studies. By screening a placental cDNA library with a

mouse Flt3 probe, Galland et al. (1992) isolated a human gene encoding a putative receptor- type tyrosine kinase. The deduced amino acid sequence of the intracellular portion of the molecule showed that it was strongly related to FLT1 (OMIM Ref. No. 165070) and KDR (OMIM Ref. No. 191306) and to a lesser degree to members of the class III receptor- type tyrosine kinases: FMS (OMIM Ref. No. 164770), PDGFR (173490, 173410), KIT (OMIM Ref. No. 164920), and FLT3 (OMIM Ref. No. 136351). Galland et al. (1992) mapped FLT4 to 5q34- q35, telomeric to the FMS and PDGFRB genes, by in situ hybridization. They assigned the mouse homolog to chromosome 11 by the same method. In the process of creating a radiation hybrid map of 18 genes, Warrington et al. (1992) demonstrated that the FLT4 gene is located on distal 5q between GABRA1 (OMIM Ref. No. 137160) at 5q34- q35 and DRD1 (OMIM Ref. No. 126449) at 5q35.1. Aprelikova et al. (1992) also mapped the FLT4 gene to 5q33- qter. Hereditary or primary lymphedema (OMIM Ref. No. 153100), first described by Milroy (1892), is a developmental disorder of the lymphatic system that leads to disabling, disfiguring swelling of the extremities, frequently of the legs. The disorder generally shows an autosomal dominant pattern

of inheritance with reduced penetrance, variable expression, and variable age of onset. Swelling may appear in one or all limbs. Swelling varies in degree and in distribution, and, if untreated, worsens over time. In rare instances, angiosarcoma may develop in affected tissues (Offori et al., 1993). Ferrell et al. (1998) confirmed the mapping of the gene for hereditary lymphedema type I (OMIM Ref. No. 153100) to 5q34- q35 and identified a specific mutation in the FLT4 gene in affected members of 1 family. Evans et al. (1999) mapped hereditary lymphedema type I to the most telomeric part of 5q35.3. Assuming that the families they studied had mutations in the FLT4 gene, the mapping of the gene is refined.

Karkkainen et al. (2000) identified mutations at the FLT4 locus in several families. They found that all disease- associated alleles analyzed had missense mutations and encoded proteins with an inactive tyrosine kinase, preventing downstream gene activation. These studies established that vascular endothelial growth factor receptor- 3 is important for normal lymphatic vascular function. In a family with hereditary lymphedema, Irrthum et al. (2000) demonstrated linkage of the disorder with markers on 5q34- q35, including a FLT4 intragenic polymorphism.

They also identified an A- to- G transition that cosegregated with the disease, predicting a histidine- to- arginine substitution in the catalytic loop of the FLT4 protein (136352.0006). In addition, they showed by in vitro expression that this mutation inhibited the autophosphorylation of the receptor. They Chy mouse mutant, characterized by accumulation of chylous ascites and swelling of the limbs, was obtained by ethylnitrosourea- induced mutagenesis (11,12:Lyon and Glenister, 1984, 1986). The phenotype is linked to mouse chromosome 11.
Karkkainen et al. (2001) sequenced the Vegfr3 candidate gene on chromosome 11 in the Chy mice and found a heterozygous 3157A- T mutation resulting in an ile1053- to- phe (OMIM Ref. No. I1053F) amino acid substitution in the tyrosine kinase domain. This mutation was located in a highly conserved catalytic domain of the receptor, in close proximity to the VEGFR3 mutations in human primary lymphedema. The I1053F mutant receptor was tyrosine kinase inactive. Although lymphedema patients with heterozygous missense mutations of VEGFR3 retain some receptor activity because of the presence of the wildtype allele (Karkkainen et al., 2000), the mutant VEGFR3 can be classified as a dominant- negative receptor similar to cer-

tain mutant KIT receptors in piebaldism (OMIM Ref. No. 172800) and RET receptors (OMIM Ref. No. 164761) in Hirschsprung disease (OMIM Ref. No. 142623). Karkkainen et al. (2001) found that neuropilin- 2 (NRP2; 602070) bound VEGFC and was expressed in the visceral, but not in the cutaneous, lymphatic endothelia. This may explain why hypoplastic cutaneous, but not visceral, lymphatic vessels were found in the Chy mice. Using virus- mediated VEGFC gene therapy, Karkkainen et al. (2001) were able to generate functional lymphatic vessels in the lymphedema mice. The results suggested that growth factor gene therapy is applicable to human lymphedema as well and provided a paradigm for other diseases associated with mutant receptors, i.e., ligand therapy.

[14482]

[14483] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14484] Irrthum, A.; Karkkainen, M. J.; Devriendt, K.; Alitalo, K.; Vikkula, M. : Congenital hereditary lymphedema caused by a mutation that inactivates VEGFR3 tyrosine kinase. Am. J. Hum. Genet. 67: 295- 301, 2000. ; and

[14485] Karkkainen, M. J.; Saaristo, A.; Jussila, L.; Karila, K. A.;

Lawrence, E. C.; Pajusola, K.; Bueler, H.; Eichmann, A.; Kauppinen, R.; Kettunen, M. I.; Yla- Herttuala, S.; Fine-gold, D. N.;.

[14486] Further studies establishing the function and utilities of FLT4 are found in John Hopkins OMIM database record ID 136352, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fbj murine os-teosarcoma viral oncogene homolog b (FOSB, Accession NP_006723.1) is another GAM94 target gene, herein des-ignated TARGET GENE. FOSB BINDING SITE1 and FOSB BINDING SITE2 are target binding sites found in untrans-lated regions of mRNA encoded by FOSB, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FOSB BINDING SITE1 and FOSB BINDING SITE2, designated SEQ ID:18954 and SEQ ID:2063 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14487] Another function of GAM94 is therefore inhibition of Fbj murine osteosarcoma viral oncogene homolog b (FOSB, Accession NP_006723.1), a gene which interacts with jun proteins enhancing their dna binding activity. and there-

fore may be associated with Cocaine addiction. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Cocaine addiction, and of other diseases and clinical conditions associated with FOSB.

[14488] The function of FOSB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM53.1.Frizzled homolog 1 (drosophila) (FZD1, Accession NP_003496.1) is another GAM94 target gene, herein designated TARGET GENE. FZD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FZD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FZD1 BINDING SITE, designated SEQ ID:9605, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14489] Another function of GAM94 is therefore inhibition of Frizzled homolog 1 (drosophila) (FZD1, Accession NP_003496.1), a gene which may be involved in bone resorption; strongly similar to rat Fzd. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FZD1.

[14490] The function of FZD1 has been established by previous studies. Members of the 'frizzled' (Fz) gene family encode 7- transmembrane domain proteins that are receptors for Wnt (see OMIM Ref. No. 164975) signaling proteins. See 601766. Liu et al. (2001) constructed a chimeric receptor with the ligand- binding and transmembrane segments from the beta- 2- adrenergic receptor (OMIM Ref. No. 109690) and the cytoplasmic domains from rat frizzled- 1. Stimulation of mouse F9 clones expressing the chimera with the beta- adrenergic agonist isoproterenol stimulated stabilization of beta- catenin (OMIM Ref. No. 116806), activation of a beta- catenin- sensitive promoter, and formation of primitive endoderm. The response was blocked by inactivation of pertussis toxin- sensitive, heterotrimeric G proteins, and by depletion of G- alpha- q (OMIM Ref. No. 600998) and G- alpha- o (OMIM Ref. No. 139311). Thus, Liu et al. (2001) concluded that G proteins are elements of Wnt/frizzled- 1 signaling to the beta- catenin- lymphoid- enhancer factor (LEF)- T- cell factor (Tcf) pathway.

[14491]

[14492] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[14493] Liu, T.; DeCostanzo, A. J.; Liu, X.; Wang, H.; Hallagan, S.; Moon, R. T.; Malbon, C. C. : G protein signaling from activated rat frizzled- 1 to the beta- catenin- Lef- Tcf pathway. Science 292: 1718- 1722, 2001. ; and

[14494] Sagara, N.; Toda, G.; Hirai, M.; Terada, M.; Katoh, M. : Molecular cloning, differential expression, and chromosomal localization of human frizzled- 1, frizzled- 2, and frizzled- 7. Bioch.

[14495] Further studies establishing the function and utilities of FZD1 are found in John Hopkins OMIM database record ID 603408, and in cited publications listed in Table 5, which are hereby incorporated by reference.Grb2-associated binding protein 2 (GAB2, Accession NP_536739.1) is another GAM94 target gene, herein designated TARGET GENE. GAB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE, designated SEQ ID:10497, to the nucleotide sequence of

GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14496] Another function of GAM94 is therefore inhibition of Grb2-associated binding protein 2 (GAB2, Accession NP_536739.1), a gene which act as adapters for transmitting various signals. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2.

[14497] The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Grb2-associated binding protein 2 (GAB2, Accession NP_036428.1) is another GAM94 target gene, herein designated TARGET GENE. GAB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE, designated SEQ ID:10497, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14498] Another function of GAM94 is therefore inhibition of

Grb2-associated binding protein 2 (GAB2, Accession NP_036428.1), a gene which act as adapters for transmitting various signals. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2.

[14499] The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068705.1) is another GAM94 target gene, herein designated TARGET GENE. GABBR1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:9593, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14500] Another function of GAM94 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068705.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with GABBR1.

[14501] Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_001461.1) is another GAM94 target gene, herein designated TARGET GENE. GABBR1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:9593, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14502] Another function of GAM94 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_001461.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1.

[14503] Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068704.1) is another GAM94 target gene, herein designated TARGET GENE. GABBR1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:9593, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14504] Another function of GAM94 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068704.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1.

[14505] GAPCENA (Accession NP_036329.2) is another GAM94 target gene, herein designated TARGET GENE. GAPCENA BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GAPCENA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAPCENA BINDING SITE, designated SEQ ID:18769, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14506] Another function of GAM94 is therefore inhibition of GAPCENA (Accession NP_036329.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with GAPCENA.

[14507] GATS (Accession NP_849153.1) is another GAM94 target gene, herein designated TARGET GENE. GATS BINDING SITE1 and GATS BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by GATS, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GATS BINDING SITE1 and GATS BINDING SITE2, designated SEQ ID:11136 and SEQ ID:4488 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14508] Another function of GAM94 is therefore inhibition of GATS (Accession NP_849153.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATS.

[14509] GDEP (Accession NP_477516.1) is another GAM94 target gene, herein designated TARGET GENE. GDEP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GDEP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GDEP BIND-

ING SITE, designated SEQ ID:4567, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14510] Another function of GAM94 is therefore inhibition of GDEP (Accession NP_477516.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDEP.

[14511] Guanine nucleotide binding protein (g protein), gamma transducing activity polypeptide 2 (GNGT2, Accession NP_113686.1) is another GAM94 target gene, herein designated TARGET GENE. GNGT2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GNGT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNGT2 BINDING SITE, designated SEQ ID:10664, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14512] Another function of GAM94 is therefore inhibition of Guanine nucleotide binding protein (g protein), gamma transducing activity polypeptide 2 (GNGT2, Accession NP_113686.1), a gene which is involved as a modulator or transducer in various transmembrane signaling systems.

Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNGT2.

[14513] The function of GNGT2 has been established by previous studies. Phototransduction in the vertebrate rod and cone photoreceptors is regulated by structurally homologous but distinct groups of signaling proteins. Ong et al. (1995) identified in bovine retinas a cone- specific G protein gamma subunit, G- gamma- c (previously named G- gamma- 8), which may play a key role in coupling the cone visual pigment to phosphodiesterase. Ong et al. (1997) characterized the human homolog, which was found to share a high degree of sequence identity with the corresponding bovine isoform (85%) and human rod G- gamma- 1 (63%). The protein is specifically localized in cones, as indicated by immunohistochemical staining. Nucleotide sequence analysis of the gene, designated GNGT2, showed a structure consisting of 3 exons and 2 introns, with the intron splice sites similar to those of the rod G- gamma- 1 gene (GNGT1; 189970). By FISH, Ong et al. (1997) localized the GNGT2 gene to 17q21.

[14514]

[14515] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[14516] Ong, O. C.; Hu, K.; Rong, H.; Lee, R. H.; Fung, B. K.- K. : Gene structure and chromosome localization of the G- gamma- c subunit of human cone G- protein (GNGT2). Genomics 44: 101- 109, 1997. ; and

[14517] Ong, O. C.; Yamane, H. K.; Phan, K. B.; Fong, H. K.; Bok, D.; Lee, R. H.; Fung, B. K.- K. : Molecular cloning and characterization of the G protein gamma subunit of cone photoreceptors.

[14518] Further studies establishing the function and utilities of GNGT2 are found in John Hopkins OMIM database record ID 603655, and in cited publications listed in Table 5, which are hereby incorporated by reference.Guanine nucleotide binding protein-like 1 (GNL1, Accession NP_005266.1) is another GAM94 target gene, herein designated TARGET GENE. GNL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GNL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNL1 BINDING SITE, designated SEQ ID:14132, to the nucleotide sequence of GAM94 RNA,

herein designated GAM RNA, also designated SEQ ID:332.

[14519] Another function of GAM94 is therefore inhibition of Guanine nucleotide binding protein-like 1 (GNL1, Accession NP_005266.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNL1.

[14520] Golgi autoantigen, golgin subfamily a, 2-like, y-linked (GOLGA2LY, Accession XP_034789.4) is another GAM94 target gene, herein designated TARGET GENE. GOLGA2LY BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GOLGA2LY, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GOLGA2LY BINDING SITE, designated SEQ ID:1437, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14521] Another function of GAM94 is therefore inhibition of Golgi autoantigen, golgin subfamily a, 2-like, y-linked (GOLGA2LY, Accession XP_034789.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA2LY.

[14522] GOR (Accession NP_758439.1) is another GAM94 target gene, herein designated TARGET GENE. GOR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GOR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GOR BINDING SITE, designated SEQ ID:2708, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14523] Another function of GAM94 is therefore inhibition of GOR (Accession NP_758439.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOR.

[14524] Glycoprotein a33 (transmembrane) (GPA33, Accession NP_005805.1) is another GAM94 target gene, herein designated TARGET GENE. GPA33 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GPA33, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPA33 BINDING SITE, designated SEQ ID:15497, to the nucleotide sequence of GAM94 RNA,

herein designated GAM RNA, also designated SEQ ID:332.

[14525] Another function of GAM94 is therefore inhibition of Glycoprotein a33 (transmembrane) (GPA33, Accession NP_005805.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPA33.

[14526] Glycoprotein m6b (GPM6B, Accession NP_005269.1) is another GAM94 target gene, herein designated TARGET GENE. GPM6B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GPM6B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPM6B BINDING SITE, designated SEQ ID:4391, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14527] Another function of GAM94 is therefore inhibition of Glycoprotein m6b (GPM6B, Accession NP_005269.1), a gene which may be involved in neural development. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPM6B.

[14528] The function of GPM6B has been established by previous

studies. Yan et al. (1993) used monoclonal antibodies raised against antigens in mouse brain fractions to isolate 2 related cDNAs from an expression library. The cDNAs, designated M6a (OMIM Ref. No. 601275) and M6b, are highly similar to the myelin proteolipid protein (OMIM Ref. No. 300401) and are expressed during early development of the mouse central nervous system. Partial human genomic and cDNA clones for M6b (symbol = GPM6B) were obtained by Olinsky et al. (1996). They found that M6b is expressed in both neurons and glia and was detected in the cerebellar Bergmann glia, in glia within white matter tracts of the cerebellum and cerebrum, and in embryonic dorsal root ganglia Olinsky et al. (1996) mapped the gene to Xp22.2 by fluorescence in situ hybridization. Narayanan et al. (1998) described the structure of the M6b gene and refined the physical mapping of the gene to a location between markers DXS69E and DXS414. They presented data from a mutation analysis on 55 patients with Rett syndrome (RTT; 312750), from which they concluded that it was very unlikely that M6b is involved in Rett syndrome. A relationship had been suggested by the fact that the gene maps to the same region of Xp as does RTT and by the fact that M6b is a member of the proteolipid protein gene

family.

[14529]

[14530] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14531] Narayanan, V.; Olinsky, S.; Dahle, E.; Naidu, S.; Zoghbi, H. Y. : Mutation analysis of the M6b gene in patients with Rett syndrome. Am. J. Med. Genet. 78: 165- 168, 1998. ; and

[14532] Olinsky, S.; Loop, B. T.; DeKosky, A.; Ripepi, B.; Weng, W.; Cummins, J.; Wenger, S. L.; Yan, Y.; Lagenaur, C.; Narayanan, V. : Chromosomal mapping of the human M6 genes. Genomics 33: 53.

[14533] Further studies establishing the function and utilities of GPM6B are found in John Hopkins OMIM database record ID 300051, and in cited publications listed in Table 5, which are hereby incorporated by reference.G protein-coupled receptor 55 (GPR55, Accession NP_005674.1) is another GAM94 target gene, herein designated TARGET GENE. GPR55 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR55, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of GPR55 BINDING SITE, designated SEQ ID:4012, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14534] Another function of GAM94 is therefore inhibition of G protein-coupled receptor 55 (GPR55, Accession NP_005674.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR55.

[14535] G protein-coupled receptor 56 (GPR56, Accession NP_005673.2) is another GAM94 target gene, herein designated TARGET GENE. GPR56 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR56, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR56 BINDING SITE, designated SEQ ID:5025, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14536] Another function of GAM94 is therefore inhibition of G protein-coupled receptor 56 (GPR56, Accession NP_005673.2), a gene which transduces extracellular signals through heterotrimeric G proteins. Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR56.

[14537] The function of GPR56 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.G protein-coupled receptor 62 (GPR62, Accession NP_543141.1) is another GAM94 target gene, herein designated TARGET GENE. GPR62 BINDING SITE1 and GPR62 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by GPR62, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR62 BINDING SITE1 and GPR62 BINDING SITE2, designated SEQ ID:14335 and SEQ ID:15063 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14538] Another function of GAM94 is therefore inhibition of G protein-coupled receptor 62 (GPR62, Accession NP_543141.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR62.

[14539] G protein-coupled receptor 72 (GPR72, Accession NP_057624.1) is another GAM94 target gene, herein designated TARGET GENE. GPR72 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR72, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR72 BINDING SITE, designated SEQ ID:15584, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14540] Another function of GAM94 is therefore inhibition of G protein-coupled receptor 72 (GPR72, Accession NP_057624.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR72.

[14541] Glutamate receptor, ionotrophic, ampa 3 (GRIA3, Accession NP_000819.1) is another GAM94 target gene, herein designated TARGET GENE. GRIA3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GRIA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRIA3

BINDING SITE, designated SEQ ID:14641, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14542] Another function of GAM94 is therefore inhibition of Glutamate receptor, ionotrophic, ampa 3 (GRIA3, Accession NP_000819.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIA3.

[14543] Glutamate receptor, ionotropic, n-methyl-d-aspartate 3a (GRIN3A, Accession NP_597702.1) is another GAM94 target gene, herein designated TARGET GENE. GRIN3A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRIN3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRIN3A BINDING SITE, designated SEQ ID:13739, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14544] Another function of GAM94 is therefore inhibition of Glutamate receptor, ionotropic, n-methyl-d-aspartate 3a (GRIN3A, Accession NP_597702.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with GRIN3A.

[14545] Goosecoid (GSC, Accession NP_776248.1) is another GAM94 target gene, herein designated TARGET GENE. GSC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GSC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GSC BINDING SITE, designated SEQ ID:17283, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14546] Another function of GAM94 is therefore inhibition of Goosecoid (GSC, Accession NP_776248.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GSC.

[14547] Heart and neural crest derivatives expressed 2 (HAND2, Accession NP_068808.1) is another GAM94 target gene, herein designated TARGET GENE. HAND2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HAND2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of HAND2 BINDING SITE, designated SEQ ID:8738, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14548] Another function of GAM94 is therefore inhibition of Heart and neural crest derivatives expressed 2 (HAND2, Accession NP_068808.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAND2.

[14549] Hepatitis b virus x associated protein (HBXAP, Accession NP_057662.2) is another GAM94 target gene, herein designated TARGET GENE. HBXAP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HBXAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HBXAP BINDING SITE, designated SEQ ID:5810, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14550] Another function of GAM94 is therefore inhibition of Hepatitis b virus x associated protein (HBXAP, Accession NP_057662.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with HBXAP.

[14551] Hemogen (HEMGN, Accession NP_060907.1) is another GAM94 target gene, herein designated TARGET GENE. HEMGN BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HEMGN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HEMGN BINDING SITE, designated SEQ ID:18446, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14552] Another function of GAM94 is therefore inhibition of Hemogen (HEMGN, Accession NP_060907.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMGN.

[14553] HIC (Accession XP_041273.1) is another GAM94 target gene, herein designated TARGET GENE. HIC BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HIC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIC BINDING

SITE, designated SEQ ID:5416, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14554] Another function of GAM94 is therefore inhibition of HIC (Accession XP_041273.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC.

[14555] HIS1 (Accession NP_006451.1) is another GAM94 target gene, herein designated TARGET GENE. HIS1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HIS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIS1 BINDING SITE, designated SEQ ID:3217, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14556] Another function of GAM94 is therefore inhibition of HIS1 (Accession NP_006451.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIS1.

[14557] High-mobility group box 2 (HMGB2, Accession NP_002120.1) is another GAM94 target gene, herein des-

ignated TARGET GENE. HMGB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HMGB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HMGB2 BINDING SITE, designated SEQ ID:15162, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14558] Another function of GAM94 is therefore inhibition of High-mobility group box 2 (HMGB2, Accession NP_002120.1), a gene which binds to single- stranded DNA, unwinds double- stranded DNA, and increases transcription. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGB2.

[14559] The function of HMGB2 has been established by previous studies. The high mobility group (HMG) proteins are localized in the nuclei of higher eukaryotes and occur in 3 families, 1 of which includes HMG1 (OMIM Ref. No. 163905) and HMG2. These proteins include a so- called HMG box which is involved in DNA binding. Both HMG1 and HMG2 proteins bind to single- stranded DNA, unwind

double- stranded DNA, and increase transcription (Wanschura et al., 1996). By screening a human genomic library with the pig thymus cDNA coding for chromosomal protein HGM2, Shirakawa and Yoshida (1992) isolated a 4,341- bp fragment containing the entire gene encoding this protein. The gene was 2,665 bp long from the start site to the end of transcription and comprised 5 exons. Length of the mRNA predicted from the exons was 1,125 bp. The canonical 5- prime regulatory motifs, CCAAT, were present, whereas the TATA element was absent from the gene. The primary structure of the human HMG2 protein consisted of 208 amino acid residues and was different from that of the pig HGM2 in only 2 amino acids; one was exchanged and the other was missing.

[14560]

[14561] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14562] Shirakawa, H.; Yoshida, M. : Structure of a gene coding for human HMG2 protein. J. Biol. Chem. 267: 6641- 6645, 1992. ; and

[14563] Wanschura, S.; Schoenmakers, E. F. P. M.; Huysmans, C.; Bartnitzke, S.; Van de Ven, W. J. M.; Bullerdiek, J. : Map-

ping of the human HMG2 gene to 4q31. Genomics 31: 264- 265, 1996.

[14564] Further studies establishing the function and utilities of HMGB2 are found in John Hopkins OMIM database record ID 163906, and in cited publications listed in Table 5, which are hereby incorporated by reference.HMP19 (Accession NP_057064.1) is another GAM94 target gene, herein designated TARGET GENE. HMP19 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HMP19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HMP19 BINDING SITE, designated SEQ ID:15566, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14565] Another function of GAM94 is therefore inhibition of HMP19 (Accession NP_057064.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMP19.

[14566] Homeo box a13 (HOXA13, Accession NP_000513.2) is another GAM94 target gene, herein designated TARGET GENE. HOXA13 BINDING SITE is a target binding site found

in the 3` untranslated region of mRNA encoded by HOXA13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXA13 BINDING SITE, designated SEQ ID:14274, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14567] Another function of GAM94 is therefore inhibition of Homeo box a13 (HOXA13, Accession NP_000513.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXA13.

[14568] Homeo box b5 (HOXB5, Accession NP_002138.1) is another GAM94 target gene, herein designated TARGET GENE. HOXB5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HOXB5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXB5 BINDING SITE, designated SEQ ID:18456, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14569] Another function of GAM94 is therefore inhibition of

Homeo box b5 (HOXB5, Accession NP_002138.1), a gene which may regulate gene expresion, morphogenesis and differentiation. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB5.

[14570] The function of HOXB5 has been established by previous studies. As reviewed by Acampora et al. (1989), the homeo box region 2 contains 9 homeo box genes in 180 kb of DNA on chromosome 17. The order, from 5- prime to 3- prime, is HOXB9 (HOX2E), HOXB8 (HOX2D), HOXB7 (HOX2C), HOXB6 (HOX2B), HOXB5 (HOX2A), HOXB4 (HOX2F), HOXB3 (HOX2G), HOXB2 (HOX2H), HOXB1 (HOX2I). Classical models of craniofacial development argue that the neural crest is prepatterned or preprogrammed to make specific head structures before its migration from the neural tube. In contrast, recent studies in several vertebrates, including mouse, chick, and zebrafish, have provided evidence for plasticity in patterning neural crest populations. Using tissue transposition and molecular analyses in avian embryos, Trainor et al. (2002) reconciled these findings by demonstrating that classical manipulation experiments, which form the basis of the prepatterning model, involved transplantation of a local

signaling center, the isthmic organizer. FGF8 (OMIM Ref. No. 600483) signaling from the isthmus alters HOXA2 expression and consequently branchial arch patterning, demonstrating that neural crest cells are patterned by environmental signals.

[14571]

[14572] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14573] Acampora, D.; D'Esposito, M.; Faiella, A.; Pannese, M.; Migliaccio, E.; Morelli, F.; Stornaiuolo, A.; Nigro, V.; Simeone, A.; Boncinelli, E. : The human HOX gene family. Nucleic Acids Res. 17: 10385- 10402, 1989. ; and

[14575] Further studies establishing the function and utilities of HOXB5 are found in John Hopkins OMIM database record ID 142960, and in cited publications listed in Table 5, which are hereby incorporated by reference.Homeo box b6 (HOXB6, Accession NP_724779.1) is another GAM94 target gene, herein designated TARGET GENE. HOXB6

BINDING SITE1 through HOXB6 BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by HOXB6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXB6 BINDING SITE1 through HOXB6 BINDING SITE3, designated SEQ ID:6159, SEQ ID:15879 and SEQ ID:6159 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14576] Another function of GAM94 is therefore inhibition of Homeo box b6 (HOXB6, Accession NP_724779.1), a gene which participates in establishing segmentation patterns and in determining segment identities. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB6.

[14577] The function of HOXB6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM48.2.Homeo box b6 (HOXB6, Accession NP_061825.2) is another GAM94 target gene, herein designated TARGET GENE. HOXB6 BINDING SITE1 through

HOXB6 BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by HOXB6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXB6 BINDING SITE1 through HOXB6 BINDING SITE3, designated SEQ ID:13497, SEQ ID:13497 and SEQ ID:6159 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14578] Another function of GAM94 is therefore inhibition of Homeo box b6 (HOXB6, Accession NP_061825.2), a gene which participates in establishing segmentation patterns and in determining segment identities. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB6.

[14579] The function of HOXB6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM48.2.Homeo box b6 (HOXB6, Accession NP_724778.1) is another GAM94 target gene, herein designated TARGET GENE. HOXB6 BINDING SITE1 through

HOXB6 BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by HOXB6, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXB6 BINDING SITE1 through HOXB6 BINDING SITE3, designated SEQ ID:15879, SEQ ID:13497 and SEQ ID:9089 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14580] Another function of GAM94 is therefore inhibition of Homeo box b6 (HOXB6, Accession NP_724778.1), a gene which participates in establishing segmentation patterns and in determining segment identities. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB6.

[14581] The function of HOXB6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM48.2.Homeo box c6 (HOXC6, Accession NP_710160.1) is another GAM94 target gene, herein designated TARGET GENE. HOXC6 BINDING SITE is a target

binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by HOXC6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXC6 BINDING SITE, designated SEQ ID:9089, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14582] Another function of GAM94 is therefore inhibition of Homeo box c6 (HOXC6, Accession NP_710160.1), a gene which is part of a developmental regulatory system. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC6.

[14583] The function of HOXC6 has been established by previous studies. Simeone et al. (1987) characterized 2 human cDNA clones, each containing a homeo box region. The corresponding genes, termed c1 (HOXB7; 142962) and c8 (HOXC6), were evaluated in different organs and body parts during human embryonic and fetal development. Differential expression suggested that the genes play a key role in a variety of developmental processes. Homeodomain- containing proteins are transcription factors

that regulate the coordinated expression of multiple genes involved in development, differentiation, and malignant transformation. Chariot et al. (1996) cloned 2 distinct forms of HOXC6 cDNA from the human breast cancer cell line MCF7. These cDNAs correspond to 2.2- and 1.8-kb transcripts that differ at their 5- prime ends and encode 153- and 235- amino acid homeodomain- containing proteins, respectively. The authors found that the 2.2-kb HOXC6 transcript is downregulated in human breast cancer cells, whereas the 1.8- kb transcript is expressed in many human tumors, including breast and ovarian carcinomas. Chariot et al. (1996) showed that both HOXC6 gene products can repress transcription from a consensus HOX- binding sequence in MDA- MB231 breast cancer cells and can cooperate with other HOX proteins, such as HOXB7, on their target genes.

[14584]

[14585] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14586] Chariot, A.; Castronovo, V.; Le, P.; Gillet, C.; Sobel, M. E.; Gielen, J. : Cloning and expression of a new HOXC6 transcript encoding a repressing protein. Biochem. J. 319: 91-

97, 1996. ; and

[14587] Simeone, A.; Mavilio, F.; Acampora, D.; Giampaolo, A.; Faiella, A.; Zappavigna, V.; D'Esposito, M.; Pannese, M.; Russo, G.; Boncinelli, E.; Peschle, C. : Two human homeobox genes, c1 an.

[14588] Further studies establishing the function and utilities of HOXC6 are found in John Hopkins OMIM database record ID 142972, and in cited publications listed in Table 5, which are hereby incorporated by reference.Hippocalcin like 4 (HPCAL4, Accession NP_057341.1) is another GAM94 target gene, herein designated TARGET GENE. HPCAL4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HPCAL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HPCAL4 BINDING SITE, designated SEQ ID:15640, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14589] Another function of GAM94 is therefore inhibition of Hippocalcin like 4 (HPCAL4, Accession NP_057341.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with HPCAL4.

[14590] HSPC056 (Accession NP_054873.1) is another GAM94 target gene, herein designated TARGET GENE. HSPC056 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSPC056, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSPC056 BINDING SITE, designated SEQ ID:15755, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14591] Another function of GAM94 is therefore inhibition of HSPC056 (Accession NP_054873.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC056.

[14592] HSPC159 (Accession NP_054900.1) is another GAM94 target gene, herein designated TARGET GENE. HSPC159 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSPC159, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSPC159 BINDING SITE, designated SEQ ID:5350, to the

nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14593] Another function of GAM94 is therefore inhibition of HSPC159 (Accession NP_054900.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC159.

[14594] Islet cell autoantigen 1, 69kda (ICA1, Accession NP_071683.1) is another GAM94 target gene, herein designated TARGET GENE. ICA1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ICA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ICA1 BINDING SITE, designated SEQ ID:6433, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14595] Another function of GAM94 is therefore inhibition of Islet cell autoantigen 1, 69kda (ICA1, Accession NP_071683.1), a gene which encodes Islet cell autoantigen 1 and therefore may be associated with Insulin- dependent diabetes mellitus. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Insulin- dependent dia-

betes mellitus, and of other diseases and clinical conditions associated with ICA1.

[14596] The function of ICA1 has been established by previous studies. Pietropaolo et al. (1993) identified a novel 69- kD peptide autoantigen (ICA69) associated with insulin- dependent diabetes mellitus (IDDM) by screening a human islet lambda- gt11 cDNA expression library with cytoplasmic islet cell antibody positive sera from relatives of IDDM patients who progressed to the overt disease. The deduced open reading frame of the ICA69 cDNA predicted a 483- amino acid protein. ICA69 showed no nucleotide or amino acid sequence relation to any known sequence in GenBank except for 2 short regions of similarity with bovine serum albumin (BSA). The ICA69 cDNA probe hybridized with a 2- kb mRNA in polyadenylated RNA from human pancreas, brain, heart, thyroid, and kidney. The structural gene for ICA69 was designated ICA1. A homolog in the mouse, designated Ica1, was mapped to the proximal end of chromosome 6, within 6 cM of the MET protooncogene (OMIM Ref. No. 164860). One can deduce from homology of synteny that the human ICA1 gene is probably located in the region 7q31, which is conserved between mouse and human. Thus, Pietropaolo et al.

(1993) added another islet antigen to the isoforms of the neuroendocrine- associated enzyme glutamic acid decarboxylase (GAD; 138275) which react with sera from IDDM patients as well as from patients with stiff- man syndrome (OMIM Ref. No. 184850). However, by isotopic in situ hybridization, Gaedigk et al. (1994) demonstrated that the ICA1 gene maps to human 7p22. Gaedigk et al. (1996) reported that the mouse Ica1 gene is distributed over more than 100 kb on chromosome 6. The single murine genomic locus contains 14 coding exons, ranging from 39 to 271 bp in length. They found that the human and mouse intron/exon junctions are identical. They cloned cDNAs and identified alternatively spliced mRNA transcripts. All splice variants encoded the conserved T- cell epitope (in exon 2) recognized by autoreactive T cells in diabetic children and diabetes- prone NOD mice.

[14597]

[14598] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14599] Gaedigk, R.; Duncan, A. M. V.; Miyazaki, I.; Robinson, B. H.; Dosch, H.- M. : ICA1 encoding p69, a protein linked to the development of type 1 diabetes, maps to human chro-

mosome 7p22. Cytogenet. Cell Genet. 66: 274- 276, 1994. ; and

[14600] Gaedigk, R.; Karges, W.; Hui, M. F.; Scherer, S. W.; Dosch, H.- M. : Genomic organization and transcript analysis of ICAp69, a target antigen in diabetic autoimmunity. Genomics 38: 382- 39.

[14601] Further studies establishing the function and utilities of ICA1 are found in John Hopkins OMIM database record ID 147625, and in cited publications listed in Table 5, which are hereby incorporated by reference.Islet cell autoantigen 1, 69kda (ICA1, Accession NP_004959.1) is another GAM94 target gene, herein designated TARGET GENE. ICA1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ICA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ICA1 BINDING SITE, designated SEQ ID:6433, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14602] Another function of GAM94 is therefore inhibition of Islet cell autoantigen 1, 69kda (ICA1, Accession NP_004959.1), a gene which encodes Islet cell autoantigen 1 and there-

fore may be associated with Insulin- dependent diabetes mellitus. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Insulin- dependent diabetes mellitus, and of other diseases and clinical conditions associated with ICA1.

[14603] The function of ICA1 has been established by previous studies. Pietropaolo et al. (1993) identified a novel 69- kD peptide autoantigen (ICA69) associated with insulin- dependent diabetes mellitus (IDDM) by screening a human islet lambda- gt11 cDNA expression library with cytoplasmic islet cell antibody positive sera from relatives of IDDM patients who progressed to the overt disease. The deduced open reading frame of the ICA69 cDNA predicted a 483- amino acid protein. ICA69 showed no nucleotide or amino acid sequence relation to any known sequence in GenBank except for 2 short regions of similarity with bovine serum albumin (BSA). The ICA69 cDNA probe hybridized with a 2- kb mRNA in polyadenylated RNA from human pancreas, brain, heart, thyroid, and kidney. The structural gene for ICA69 was designated ICA1. A homolog in the mouse, designated Ica1, was mapped to the proximal end of chromosome 6, within 6 cM of the MET protooncogene (OMIM Ref. No. 164860). One can deduce

from homology of synteny that the human ICA1 gene is probably located in the region 7q31, which is conserved between mouse and human. Thus, Pietropaolo et al. (1993) added another islet antigen to the isoforms of the neuroendocrine- associated enzyme glutamic acid decarboxylase (GAD; 138275) which react with sera from IDDM patients as well as from patients with stiff- man syndrome (OMIM Ref. No. 184850). However, by isotopic in situ hybridization, Gaedigk et al. (1994) demonstrated that the ICA1 gene maps to human 7p22. Gaedigk et al. (1996) reported that the mouse Ica1 gene is distributed over more than 100 kb on chromosome 6. The single murine genomic locus contains 14 coding exons, ranging from 39 to 271 bp in length. They found that the human and mouse intron/exon junctions are identical. They cloned cDNAs and identified alternatively spliced mRNA transcripts. All splice variants encoded the conserved T- cell epitope (in exon 2) recognized by autoreactive T cells in diabetic children and diabetes- prone NOD mice.

[14604]

[14605] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14606] Gaedigk, R.; Duncan, A. M. V.; Miyazaki, I.; Robinson, B. H.; Dosch, H.- M. : ICA1 encoding p69, a protein linked to the development of type 1 diabetes, maps to human chromosome 7p22. Cytogenet. Cell Genet. 66: 274- 276, 1994. ; and

[14607] Gaedigk, R.; Karges, W.; Hui, M. F.; Scherer, S. W.; Dosch, H.- M. : Genomic organization and transcript analysis of ICAp69, a target antigen in diabetic autoimmunity. Genomics 38: 382- 39.

[14608] Further studies establishing the function and utilities of ICA1 are found in John Hopkins OMIM database record ID 147625, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interferon (alpha, beta and omega) receptor 2 (IFNAR2, Accession NP_000865.2) is another GAM94 target gene, herein designated TARGET GENE. IFNAR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IFNAR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IFNAR2 BINDING SITE, designated SEQ ID:15907, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14609] Another function of GAM94 is therefore inhibition of Interferon (alpha, beta and omega) receptor 2 (IFNAR2, Accession NP_000865.2), a gene which is a receptor for interferons alpha and beta. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFNAR2.

[14610] The function of IFNAR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Insulin-like growth factor 1 (somatomedin c) (IGF1, Accession NP_000609.1) is another GAM94 target gene, herein designated TARGET GENE. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGF1 BINDING SITE, designated SEQ ID:12026, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14611] Another function of GAM94 is therefore inhibition of Insulin-like growth factor 1 (somatomedin c) (IGF1, Accession NP_000609.1), a gene which are structurally and

functionally related to insulin but have a much higher growth- promoting activity and therefore may be associated with Growth retardation with sensorineural deafness and mental retardation. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Growth retardation with sensorineural deafness and mental retardation, and of other diseases and clinical conditions associated with IGF1.

[14612] The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.2.Interleukin 15 receptor, alpha (IL15RA, Accession NP_002180.1) is another GAM94 target gene, herein designated TARGET GENE. IL15RA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL15RA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL15RA BINDING SITE, designated SEQ ID:17728, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14613] Another function of GAM94 is therefore inhibition of In-

terleukin 15 receptor, alpha (IL15RA, Accession NP_002180.1), a gene which is essential for signal transduction. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL15RA.

[14614] The function of IL15RA has been established by previous studies. Interleukin 2 (OMIM Ref. No. 147680) and interleukin 15 (OMIM Ref. No. 600554) are cytokines with overlapping but distinct biologic effects. Their receptors share 2 subunits, the IL2R beta (OMIM Ref. No. 146710) and gamma (OMIM Ref. No. 308380) chains, which are essential for signal transduction. The IL2 receptor requires an additional IL2- specific alpha subunit for high affinity IL2 binding (OMIM Ref. No. 147730). Giri et al. (1995) identified and cloned a murine IL15- specific alpha subunit and showed that it is structurally related to IL2R- alpha. However, the murine IL15R- alpha alone bound IL15 with a 1,000- fold higher affinity than that seen with IL2R- alpha and IL2. Anderson et al. (1995) extended these studies into the human system with the isolation of 3 differentially spliced human IL15R- alpha variants that are all capable of high affinity binding of IL15. The cytoplasmic domain of IL15R- alpha, like that of IL2R- alpha is

dispensable for mitogenic signaling, suggesting that the primary role of the alpha chains is to confer high affinity binding. At high concentrations, IL- 15, like IL- 2, is able to signal through a complex of IL2R- beta and - gamma in the absence of the alpha subunit. Furthermore, the IL15RA and IL2RA genes have a similar intron/exon organization and are closely linked in both human and murine genomes. The IL2RA gene (OMIM Ref. No. 147730) had been previously mapped to 10p15- p14 and its homolog to mouse chromosome 2. The human gene IL15RA was mapped to 10p15- p14 by fluorescence in situ hybridization and the mouse Il15ra gene was mapped to chromosome 2 by interspecific backcross mapping.

[14615]

[14616] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14617] Anderson, D. M.; Kumaki, S.; Ahdieh, M.; Bertles, J.; Tometsko, M.; Loomis, A.; Giri, J.; Copeland, N. G.; Gilbert, D. J.; Jenkins, N. A.; Valentine, V.; Shapiro, D. N.; Morris, S. W.; Park, L. S.; Cosman, D. : Functional characterization of the human interleukin- 15 receptor alpha chain and close linkage of IL15RA and IL2RA genes. J. Biol. Chem. 270:

29862- 29869, 1995. ; and

[14619] Further studies establishing the function and utilities of IL15RA are found in John Hopkins OMIM database record ID 601070, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interleukin 15 receptor, alpha (IL15RA, Accession NP_751950.1) is another GAM94 target gene, herein designated TARGET GENE. IL15RA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL15RA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL15RA BINDING SITE, designated SEQ ID:17728, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14620] Another function of GAM94 is therefore inhibition of Interleukin 15 receptor, alpha (IL15RA, Accession NP_751950.1), a gene which is essential for signal trans-

duction. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL15RA.

[14621] The function of IL15RA has been established by previous studies. Interleukin 2 (OMIM Ref. No. 147680) and interleukin 15 (OMIM Ref. No. 600554) are cytokines with overlapping but distinct biologic effects. Their receptors share 2 subunits, the IL2R beta (OMIM Ref. No. 146710) and gamma (OMIM Ref. No. 308380) chains, which are essential for signal transduction. The IL2 receptor requires an additional IL2- specific alpha subunit for high affinity IL2 binding (OMIM Ref. No. 147730). Giri et al. (1995) identified and cloned a murine IL15- specific alpha subunit and showed that it is structurally related to IL2R- alpha. However, the murine IL15R- alpha alone bound IL15 with a 1,000- fold higher affinity than that seen with IL2R- alpha and IL2. Anderson et al. (1995) extended these studies into the human system with the isolation of 3 differentially spliced human IL15R- alpha variants that are all capable of high affinity binding of IL15. The cytoplasmic domain of IL15R- alpha, like that of IL2R- alpha is dispensable for mitogenic signaling, suggesting that the primary role of the alpha chains is to confer high affinity

binding. At high concentrations, IL- 15, like IL- 2, is able to signal through a complex of IL2R- beta and - gamma in the absence of the alpha subunit. Furthermore, the IL15RA and IL2RA genes have a similar intron/exon organization and are closely linked in both human and murine genomes. The IL2RA gene (OMIM Ref. No. 147730) had been previously mapped to 10p15- p14 and its homolog to mouse chromosome 2. The human gene IL15RA was mapped to 10p15- p14 by fluorescence in situ hybridization and the mouse Il15ra gene was mapped to chromosome 2 by interspecific backcross mapping.

IL19 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by IL19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL19 BINDING SITE, designated SEQ ID:1253, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14627] Another function of GAM94 is therefore inhibition of Interleukin 19 (IL19, Accession NP_037503.2), a gene which may play a role in B- cell activation and autoantibody production. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL19.

[14628] The function of IL19 has been established by previous studies. Interleukin- 10 (IL10; 124092) is a multifunctional cytokine that has antiinflammatory properties through its ability to downregulate antigen presentation and macrophage activation. It also plays a role in B- cell activation and autoantibody production. The IL10 family of cytokines includes IL19, IL20 (OMIM Ref. No. 605619), MDA7 (OMIM Ref. No. 604136), and IL22 (OMIM Ref. No. 605330). By searching EST databases using IL10 as the probe, followed by screening an Epstein- Barr virus-transformed B- cell cDNA library, Gallagher et al. (2000) obtained a cDNA encoding IL19. Sequence analysis predicted that the 177- amino acid protein contains a signal peptide, 2 potential N- linked glycosylation sites, and 4 conserved cysteine residues necessary for correct folding of the IL10 monomer. IL19 shares 82% identity with IL10 in the hydrophobic core, but only 53% similarity in the putative IL10 receptor- alpha (OMIM Ref. No. 146933)- interacting residues. Northern blot kinetic analysis detected expression of IL10 before IL19 in lipopolysaccharide (LPS)- stimulated monocytes. IL19 expression was enhanced in the presence of IL4 (OMIM Ref. No. 147780) or IL13 (OMIM Ref. No. 147683), but not gamma- interferon

(OMIM Ref. No. 147570), in LPS- stimulated monocytes. Granulocyte- macrophage colony- stimulating factor (GMCSF; 138960), but not other cytokines, was capable of inducing IL19 expression. Western blot analysis showed expression of a 35- to 40- kD protein that was reduced to 21 kD by glycosidase treatment. Genomic sequence analysis determined that the IL19 gene spans nearly 6 kb and, like IL10, contains 5 exons

[14629]

[14633] Further studies establishing the function and utilities of IL19 are found in John Hopkins OMIM database record ID

605687, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interleukin 1 receptor-like 1 (IL1RL1, Accession NP_057316.3) is another GAM94 target gene, herein designated TARGET GENE. IL1RL1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by IL1RL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL1RL1 BINDING SITE, designated SEQ ID:15835, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14634] Another function of GAM94 is therefore inhibition of Interleukin 1 receptor-like 1 (IL1RL1, Accession NP_057316.3), a gene which is possibly involved in regulation of t- lymphocyte action. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RL1.

[14635] The function of IL1RL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Interleukin 2 (IL2, Accession NP_000577.2) is another GAM94 target gene, herein designated TARGET

GENE. IL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL2 BINDING SITE, designated SEQ ID:4856, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14636] Another function of GAM94 is therefore inhibition of Interleukin 2 (IL2, Accession NP_000577.2), a gene which is a powerfully immunoregulatory lymphokine that is produced by lectin- or antigen- activated T cells. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL2.

[14637] The function of IL2 has been established by previous studies. Interleukin- 2 (IL2), formerly referred to as T- cell growth factor, is a powerfully immunoregulatory lymphokine that is produced by lectin- or antigen- activated T cells. Not only is it produced by mature T lymphocytes on stimulation but also constitutively by certain T- cell lymphoma cell lines. It is useful in the study of the molecular nature of T- cell differentiation and because, like in-

terferons, it augments natural killer cell activity, it might have use in the treatment of cancer. Lowenthal et al. (1985) presented evidence that IL2 can act as a growth hormone for both B and T lymphocytes. Thus, IL2 is a better designation than TCGF. See review of Smith (1988). IL2 has a molecular weight of 15,000. Taniguchi et al. (1983) cloned the human IL2 gene. Fujita et al. (1983) found that the IL2 gene has a promoter sequence homologous to that of the human gamma interferon gene. Using a cloned human TCGF gene in somatic cell hybridization studies, Seigel et al. (1984) assigned the TCGF locus to chromosome 4. In situ hybridization narrowed the assignment to 4q26- q28. Evidence was presented to indicate that TCGF and RAF2 (OMIM Ref. No. 164760), the pseudogene form of the oncogene RAF1, is not closely linked to TCGF although it is on chromosome 4. Fiorentino et al. (1989) assigned the Il2 locus to mouse chromosome 3 by Southern analysis of Chinese hamster/mouse somatic cell hybrid cells, and Webb et al. (1990) localized it to bands B- C by in situ hybridization

[14638]

[14639] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[14640] Shows, T.; Eddy, R.; Haley, L.; Byers, M.; Henry, M.; Fujita, T.; Matsui, H.; Taniguchi, T. : Interleukin 2 (IL2) is assigned to human chromosome 4. Somat. Cell Molec. Genet. 10: 315- 318, 1984. ; and

[14641] Smith, K. A. : Interleukin- 2: inception, impact, and implications. Science 240: 1169- 1176, 1988.

[14642] Further studies establishing the function and utilities of IL2 are found in John Hopkins OMIM database record ID 147680, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interleukin 28 receptor, alpha (IL28RA, Accession NP_775088.1) is another GAM94 target gene, herein designated TARGET GENE. IL28RA BINDING SITE1 and IL28RA BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by IL28RA, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL28RA BINDING SITE1 and IL28RA BINDING SITE2, designated SEQ ID:18482 and SEQ ID:2495 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14643] Another function of GAM94 is therefore inhibition of Interleukin 28 receptor, alpha (IL28RA, Accession NP_775088.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL28RA.

[14644] Interleukin 6 receptor (IL6R, Accession NP_000556.1) is another GAM94 target gene, herein designated TARGET GENE. IL6R BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL6R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL6R BINDING SITE, designated SEQ ID:10665, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14645] Another function of GAM94 is therefore inhibition of Interleukin 6 receptor (IL6R, Accession NP_000556.1), a gene which is essential to the regulation of the immune response, hematopoiesis, and acute- phase reactions. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL6R.

[14646] The function of IL6R has been established by previous studies. Whereas the 0.9- kb IFN- beta- 1 mRNA is transcribed from an intron- free IFNB1 gene located on 9p (OMIM Ref. No. 147640), IFN- beta- 2 is the translation product of a 1.3- kb mRNA derived from an intron- containing IFNB2 gene not located on chromosome 9. The IFN- beta- 2 mRNA does not cross- hybridize with IFN- beta- 1 cDNA probes and vice- versa. Sehgal et al. (1986) mapped IFNB2 to chromosome 7 by means of a cDNA clone in blot- hybridization experiments on DNA from a panel of human- rodent somatic cell hybrids. Zilberstein et al. (1986) cloned cDNA for the 1.3- kb RNA designated IFNB2. Expression studies showed that the IFN- beta- 2 secreted by DNA- transformed rodent cells is a processed 21- kD protein whose activity is cross- neutralized by antibodies to human IFN- beta- 1 but not to alpha or gamma interferon. The biologic significance of IFN- beta- 2 lies in the fact that it is induced under conditions in which IFN- beta- 1 is not induced, as in metabolically stressed cells. Its induction by IL1 (OMIM Ref. No. 147720) and TNF (OMIM Ref. No. 191160) suggests that it may play a role as an autocrine mediator of some effects of these cytokines in inflammation and acute phase re-

sponses, as well as regulate cell proliferation. As discussed by Sehgal et al. (1987), IFNB2 is identical to B- cell differentiation factor (BSF2) and enhances proliferation in hybridoma/plasmacytoma cells. Hirano et al. (1986) reported the molecular cloning, structural analysis, and functional expression of cDNA encoding human BSF2. The primary sequence of BSF2 deduced from the cDNA shows that it has 184 amino acids and is distinct from other interleukins. In addition to its antiviral activity, beta- 2 interferon elicits acute phase response in liver cells and is identical to hepatocyte stimulatory factor. It also is identical to hybridoma growth factor. A subset of plasmacytoma (PCT), designated extramedullary PCT, is distinguished from multiple myeloma and solitary PCT of bone by its distribution among various tissue sites but not bone marrow. Extramedullary (extraosseus) PCTs are rare spontaneous neoplasms of mice but are readily induced in a susceptible strain, BALB/c, by treatment with pristane. The tumors develop in peritoneal granulomas and are characterized by Myc- activating t(12;15) chromosomal translocations and, most frequently, by secretion of IgA. To test directly the contribution of IL6 to PCT development, Kovalchuk et al. (2002) generated BALB/c mice carrying a

widely expressed IL6 transgene. All mice exhibited lymphoproliferation and plasmacytosis. By 18 months of age, more than half developed readily transplantable PCTs in lymph nodes, Peyer patches, and sometimes spleen. These neoplasms also had the t(12;15) translocations, but remarkably, none expressed IgA. Approximately 30% of the mice developed follicular and diffuse large cell B- cell lymphomas that often coexisted with PCTs. These findings provided a unique model of extramedullary PCT for studies on pathogenesis and treatment and suggested a role for IL6 in the genesis of germinal center- derived lymphomas

[14647]

[14648] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14655] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14656] Hirano, T.; Yasukawa, K.; Harada, H.; Taga, T.; Watanabe, Y.; Matsuda, T.; Kashiwamura, S.; Nakajima, K.; Koyama, K.; Iwamatsu, A.; Tsunasawa, S.; Sakiyama, F.; Matsui, H.; Takahara, Y.; Taniguchi, T.; Kishimoto, T. : Complementary DNA for a novel human interleukin (BSF- 2) that in-

duces B lymphocytes to produce immunoglobulin. Nature 324: 73- 76, 1986. ; and

[14657] Kovalchuk, A. L.; Kim, J. S.; Park, S. S.; Coleman, A. E.; Ward, J. M.; Morse, H. C, III; Kishimoto, T.; Potter, M.; Janz, S. : IL- 6 transgenic mouse model for extraosseous plasmacytoma.

[14658] Further studies establishing the function and utilities of IL6R are found in John Hopkins OMIM database record ID 147880, and in cited publications listed in Table 5, which are hereby incorporated by reference.Inhibitor of growth family, member 3 (ING3, Accession NP_061944.1) is another GAM94 target gene, herein designated TARGET GENE. ING3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ING3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ING3 BINDING SITE, designated SEQ ID:3094, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14659] Another function of GAM94 is therefore inhibition of Inhibitor of growth family, member 3 (ING3, Accession NP_061944.1) . Accordingly, utilities of GAM94 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with ING3.

[14660] IPO8 (Accession NP_006381.1) is another GAM94 target gene, herein designated TARGET GENE. IPO8 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IPO8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IPO8 BINDING SITE, designated SEQ ID:3120, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14661] Another function of GAM94 is therefore inhibition of IPO8 (Accession NP_006381.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IPO8.

[14662] Janus kinase 2 (a protein tyrosine kinase) (JAK2, Accession NP_004963.1) is another GAM94 target gene, herein designated TARGET GENE. JAK2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by JAK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of JAK2 BINDING SITE, designated SEQ ID:17718, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14663] Another function of GAM94 is therefore inhibition of Janus kinase 2 (a protein tyrosine kinase) (JAK2, Accession NP_004963.1), a gene which tyrosine kinase of the non-receptor type, involved in interleukin 3 signal transduction. and therefore may be associated with Pre- b acute myeloid leukemia. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Pre- b acute myeloid leukemia, and of other diseases and clinical conditions associated with JAK2.

[14664] The function of JAK2 has been established by previous studies. JAK2 kinase is a member of a family of tyrosine kinases involved in cytokine receptor signaling. See 147795 for background information on Janus kinases In addition to its role as a kidney cytokine regulating hematopoiesis, erythropoietin (OMIM Ref. No. 133170) is also produced in the brain after oxidative or nitrosative stress. The transcription factor HIF1 (OMIM Ref. No. 603348) upregulates erythropoietin following hypoxic stimuli. Digicaylioglu and Lipton (2001) demonstrated that preconditioning with erythropoietin protects neurons in

models of ischemic and degenerative damage due to excitotoxins and consequent generation of free radicals, including nitric oxide. Activation of neuronal erythropoietin receptors (EPOR; 133171) prevents apoptosis induced by NMDA or nitric oxide by triggering crosstalk between the signaling pathways JAK2 and NFKB (see OMIM Ref. No. 164011). Digicaylioglu and Lipton (2001) demonstrated that erythropoietin receptor- mediated activation of JAK2 leads to phosphorylation of the inhibitor of NFKB (I-kappa- B- alpha; 164008), subsequent nuclear translocation of the transcription factor NFKB, and NFKB- dependent transcription of neuroprotective genes. Transfection of cerebrocortical neurons with a dominant interfering form of JAK2 or an I- kappa- B- alpha superrepressor blocks erythropoietin- mediated prevention of neuronal apoptosis. Thus, neuronal erythropoietin receptors activate a neuroprotective pathway that is distinct from previously well characterized JAK and NFKB functions. Moreover, this erythropoietin effect may underlie neuroprotection mediated by hypoxic- ischemic preconditioning. Huang et al. (2001) showed that JAK2, and more specifically just its intact N- terminal domain, binds to EPOR in the endoplasmic reticulum and promotes its cell surface

expression. This interaction was specific, as JAK1 had no effect. Residues 32 to 58 of the JAK2 JH7 domain were required for EPOR surface expression. Alanine scanning mutagenesis of the EPOR membrane proximal region revealed 2 modes of EPOR- JAK2 interaction. A continuous block of EPOR residues was required for functional, ligand- independent binding to JAK2 and cell surface receptor expression, whereas 4 specific residues were essential in switching on prebound JAK2 after ligand binding. Thus, in addition to its kinase activity required for cytokine receptor signaling, JAK is also an essential subunit required for surface expression of cytokine receptors.

[14665] Animal model experiments lend further support to the function of JAK2. Neubauer et al. (1998) also performed a targeted inactivation of Jak2 in mice. Jak2 - /- embryos were anemic and died around day 12.5 postcoitum. Primitive erythrocytes were found, but definitive erythropoiesis was absent. Compared to erythropoietin receptor- deficient mice, the phenotype of Jak2 deficiency was more severe. Fetal liver BFU- E and CFU- E colonies were completely absent. However, multilineage hematopoietic stem cells (CD34- low, c- kit- pos) were found, and B lymphopoiesis appeared intact. In contrast to IFN- alpha

stimulation, Jak2 - /- cells did not respond to IFN-gamma. Jak2 - /- embryonic stem cells were competent for LIF signaling. These data also demonstrated that Jak2 has pivotal functions for signal transduction of a set of cytokine receptors required in definitive erythropoiesis

[14666] It is appreciated that the abovementioned animal model for JAK2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[14667] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14668] Neubauer, H.; Cumano, A.; Muller, M.; Wu, H.; Huffstadt, U.; Pfeffer, K. : Jak2 deficiency defines an essential developmental checkpoint in definitive hematopoiesis. Cell 93: 397- 409, 1998. ; and

[14669] Digicaylioglu, M.; Lipton, S. A. : Erythropoietin- mediated neuroprotection involves cross- talk between Jak2 and NF- kappa- B signalling cascades. Nature 412: 641- 647, 2001.

[14670] Further studies establishing the function and utilities of JAK2 are found in John Hopkins OMIM database record ID 147796, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Potassium voltage-gated channel, shaker-related subfamily, member 4 (KCNA4, Accession NP_002224.1) is another GAM94 target gene, herein designated TARGET GENE. KCNA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNA4 BINDING SITE, designated SEQ ID:3266, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14671] Another function of GAM94 is therefore inhibition of Potassium voltage-gated channel, shaker-related subfamily, member 4 (KCNA4, Accession NP_002224.1), a gene which might be important in the regulation of the fast repolarizing phase of action potentials in heart. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNA4.

[14672] The function of KCNA4 has been established by previous studies. Potassium voltage- gated ion channels are highly diverse membrane proteins that seem to be present in

nearly every eukaryotic cell (see OMIM Ref. No. 176260). The rat genome encodes a potassium- channel (K- channel) family (RCK) homologous to the Shaker channels of Drosophila (Stuehmer et al., 1989). Only 1 member of this rat K- channel family, RCK4, was found to express A-type, i.e., rapidly inactivating, K- channels. Philipson et al. (1990) provided the sequence of the cDNA corresponding to a fetal skeletal muscle potassium channel related to RCK4. The predicted 653- amino acid PCN2 protein shares 55% sequence identity with PCN1 (OMIM Ref. No. 176267) (Philipson et al., 1991). Tamkun et al. (1991) cloned a full- length human cDNA showing 97% identity to RCK4 and referred to it as HK1. HK1 mRNA was expressed in heart, in particular in the atrium and ventricle. Therefore, they concluded that the K- channel formed by this protein might be important in the regulation of the fast repolarizing phase of action potentials in heart and thus might influence the duration of cardiac action potential. Grandy et al. (1992) mapped the KCNA4 gene to 11p14-p13. Using PCR, Gessler et al. (1992) produced a genomic HK1 DNA probe to map the gene on human chromosome 11p14 by study of somatic cell hybrids and by pulsed field gel electrophoresis (PFGE). The somatic cell hybrid analy-

sis demonstrated that the gene is in the WAGR (OMIM Ref. No. 137357) region. PFGE analysis and comparison with the well- established PFGE map of the region localized the gene to 11p14, 200 to 600 kb telomeric to FSHB (OMIM Ref. No. 136530). Thus, as the FSHB gene is located at 11p14, close to the 11p13/p14 boundary, the HK1 gene could be assigned to the proximal part of that band, namely, 11p14.1. From observations in cases of WAGR leading to deletion in this region, Gessler et al. (1992) concluded that a hemizygous deletion of HK1 may have little phenotypic effect, perhaps because of less stringent requirements for the control of expression levels for this gene. The HK1 gene is located in the wrong position to be a plausible candidate gene for the long QT syndrome (LQT1; 192500). Philipson et al. (1993) mapped a potas- sium channel gene, which they symbolized KCNA4, to 11q13.4- q14.1 by a combination of segregation in a panel of reduced human- mouse somatic cell hybrids and isotopic in situ hybridization

[14673]

[14674] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14675] Gessler, M.; Grupe, A.; Grzeschik, K.- H.; Pongs, O. : The potassium channel gene HK1 maps to human chromosome 11p14.1, close to the FSHB gene. Hum. Genet. 90: 319- 321, 1992. ; and

[14676] Grandy, D.; Mathew, M. K.; Ramaswami, M.; Tanouye, M.; Sheffield, V.; Jones, C. A.; Al- Dhalimi, M.; Zhang, Y.; Saez, C.; Litt, M. : A human voltage- gated potassium channel gene, HuKII, m.

[14677] Further studies establishing the function and utilities of KCNA4 are found in John Hopkins OMIM database record ID 176266, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium inwardly-rectifying channel, subfamily j, member 15 (KCNJ15, Accession NP_002234.2) is another GAM94 target gene, herein designated TARGET GENE. KCNJ15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNJ15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ15 BINDING SITE, designated SEQ ID:18499, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14678] Another function of GAM94 is therefore inhibition of Potassium inwardly-rectifying channel, subfamily j, member 15 (KCNJ15, Accession NP_002234.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ15.

[14679] Potassium inwardly-rectifying channel, subfamily j, member 15 (KCNJ15, Accession NP_733932.1) is another GAM94 target gene, herein designated TARGET GENE. KCNJ15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNJ15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ15 BINDING SITE, designated SEQ ID:18499, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14680] Another function of GAM94 is therefore inhibition of Potassium inwardly-rectifying channel, subfamily j, member 15 (KCNJ15, Accession NP_733932.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with KCNJ15.

[14681] Potassium inwardly-rectifying channel, subfamily j, member 15 (KCNJ15, Accession NP_733933.1) is another GAM94 target gene, herein designated TARGET GENE. KCNJ15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNJ15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ15 BINDING SITE, designated SEQ ID:18499, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14682] Another function of GAM94 is therefore inhibition of Potassium inwardly-rectifying channel, subfamily j, member 15 (KCNJ15, Accession NP_733933.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ15.

[14683] Potassium channel, subfamily k, member 6 (KCNK6, Accession NP_004814.1) is another GAM94 target gene, herein designated TARGET GENE. KCNK6 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by KCNK6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNK6 BINDING SITE, designated SEQ ID:2279, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14684] Another function of GAM94 is therefore inhibition of Potassium channel, subfamily k, member 6 (KCNK6, Accession NP_004814.1), a gene which is an inward rectifying potassium channel protein. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK6.

[14685] The function of KCNK6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Potassium large conductance calcium-activated channel, subfamily m beta member 3 (KCNMB3, Accession NP_741981.1) is another GAM94 target gene, herein designated TARGET GENE. KCNMB3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by KCNMB3, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNMB3 BINDING SITE, designated SEQ ID:5079, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14686] Another function of GAM94 is therefore inhibition of Potassium large conductance calcium-activated channel, subfamily m beta member 3 (KCNMB3, Accession NP_741981.1), a gene which is similar to a regulatory subunit of Ca- activated potassium channel. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNMB3.

[14687] The function of KCNMB3 has been established by previous studies. The large conductance, calcium- activated potassium (BK) channel is a member of the Shaker- related 6-transmembrane domain potassium channel superfamily that is sensitive to voltage and calcium. BK channels are composed of a pore- forming alpha subunit (KCNMA1, or HSLO; 600150) and, in some tissues, a beta subunit. The beta- 1 subunit (KCNMB1; 603951) is expressed predominantly in smooth muscle cells, whereas the beta- 2 subunit (KCNMB2; 605214) is expressed in endocrine tissue,

such as adrenal chromaffin cells Uebele et al. (2000) determined that KCNMB3 is a family of 4 related subunits, KCNMB3a (277 amino acids), KCNMB3b (257 amino acids), KCNMB3c (275 amino acids), and KCNMB3d (279 amino acids), that arise from alternative splicing. The subunits vary only in their cytoplasmic N- terminal sequences and share 256 C- terminal amino acids. Genomic sequence analysis determined that the KCNMB3 gene contains 6 exons, 3 of which (1a, 1b, and 1c/d) encode sequences unique to each of the splice variants. RT- PCR analysis showed that KCNMB3a has a relatively restricted distribution (spleen, placenta, pancreas, kidney, and heart), while the other variants are more widely expressed. KCNMB3c was notably abundant in pancreas. In situ hybridization analysis demonstrated that KCNMB3c expression is restricted to pancreatic beta cells. Coexpression of KCNMB3a, - b, and - c with KCNMA1 resulted in partial inactivation of activating currents; KCNMB3d did not induce detectable inactivation. By FISH and somatic cell hybrid analysis, Riazi et al. (1999) mapped the KCNMB3 gene to 3q26.3- q27. Uebele et al. (2000) also mapped the KCNMB3 gene to 3q26.3- q27.1, in close proximity to KCNMB2, by radiation hybrid and FISH analysis

[14688]

[14689] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14690] Behrens, R.; Nolting, A.; Reimann, F.; Schwarz, M.; Waldschutz, R.; Pongs, O. : hKCNMB3 and hKCNMB4, cloning and characterization of two members of the large- conductance calcium- activated potassium channel beta subunit family. FEBS Lett. 474: 99- 106, 2000. ; and

[14691] Brenner, R.; Jegla, T. J.; Wickenden, A.; Liu, Y.; Aldrich, R. W. : Cloning and functional characterization of novel large conductance calcium- activated potassium channel beta subunits.

[14692] Further studies establishing the function and utilities of KCNMB3 are found in John Hopkins OMIM database record ID 605222, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium large conductance calcium-activated channel, subfamily m beta member 3 (KCNMB3, Accession NP_055222.3) is another GAM94 target gene, herein designated TARGET GENE. KCNMB3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by KCNMB3, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNMB3 BINDING SITE, designated SEQ ID:5079, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14693] Another function of GAM94 is therefore inhibition of Potassium large conductance calcium-activated channel, subfamily m beta member 3 (KCNMB3, Accession NP_055222.3), a gene which is similar to a regulatory subunit of Ca- activated potassium channel. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNMB3.

[14694] The function of KCNMB3 has been established by previous studies. The large conductance, calcium- activated potassium (BK) channel is a member of the Shaker- related 6-transmembrane domain potassium channel superfamily that is sensitive to voltage and calcium. BK channels are composed of a pore- forming alpha subunit (KCNMA1, or HSLO; 600150) and, in some tissues, a beta subunit. The beta- 1 subunit (KCNMB1; 603951) is expressed predominantly in smooth muscle cells, whereas the beta- 2 sub-

unit (KCNMB2; 605214) is expressed in endocrine tissue, such as adrenal chromaffin cells Uebele et al. (2000) determined that KCNMB3 is a family of 4 related subunits, KCNMB3a (277 amino acids), KCNMB3b (257 amino acids), KCNMB3c (275 amino acids), and KCNMB3d (279 amino acids), that arise from alternative splicing. The subunits vary only in their cytoplasmic N- terminal sequences and share 256 C- terminal amino acids. Genomic sequence analysis determined that the KCNMB3 gene contains 6 exons, 3 of which (1a, 1b, and 1c/d) encode sequences unique to each of the splice variants. RT- PCR analysis showed that KCNMB3a has a relatively restricted distribution (spleen, placenta, pancreas, kidney, and heart), while the other variants are more widely expressed. KCNMB3c was notably abundant in pancreas. In situ hybridization analysis demonstrated that KCNMB3c expression is restricted to pancreatic beta cells. Coexpression of KCNMB3a, - b, and - c with KCNMA1 resulted in partial inactivation of activating currents; KCNMB3d did not induce detectable inactivation. By FISH and somatic cell hybrid analysis, Riazi et al. (1999) mapped the KCNMB3 gene to 3q26.3- q27. Uebele et al. (2000) also mapped the KCNMB3 gene to 3q26.3- q27.1, in close proximity to KC-

NMB2, by radiation hybrid and FISH analysis

[14695]

[14696] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14697] Behrens, R.; Nolting, A.; Reimann, F.; Schwarz, M.; Waldschutz, R.; Pongs, O. : hKCNMB3 and hKCNMB4, cloning and characterization of two members of the large- conductance calcium- activated potassium channel beta subunit family. FEBS Lett. 474: 99- 106, 2000. ; and

[14698] Brenner, R.; Jegla, T. J.; Wickenden, A.; Liu, Y.; Aldrich, R. W. : Cloning and functional characterization of novel large conductance calcium- activated potassium channel beta subunits.

[14699] Further studies establishing the function and utilities of KCNMB3 are found in John Hopkins OMIM database record ID 605222, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium intermediate/small conductance calcium-activated channel, subfamily n, member 3 (KCNN3, Accession NP_740752.1) is another GAM94 target gene, herein designated TARGET GENE. KCNN3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of

mRNA encoded by KCNN3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNN3 BINDING SITE, designated SEQ ID:10793, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14700] Another function of GAM94 is therefore inhibition of Potassium intermediate/small conductance calcium-activated channel, subfamily n, member 3 (KCNN3, Accession NP_740752.1), a gene which forms a voltage- independent potassium channel activated by intracellular calcium. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNN3.

[14701] The function of KCNN3 has been established by previous studies. Action potentials in vertebrate neurons are followed by an afterhyperpolarization (AHP) that may persist for several seconds and may have profound consequences for the firing pattern of the neuron. Each component of the AHP is kinetically distinct and is mediated by different calcium- activated potassium channels. SK channels are activated in a voltage- independent manner and have a

relatively small unit conductance and high sensitivity to calcium. See 602754. Kohler et al. (1996) isolated rat and human brain cDNAs encoding a family of SK channels which they designated SK1 (KCNN1; 602982), SK2 (OMIM Ref. No. 605879), and SK3. All 3 proteins contain intracellular N and C termini and 6 highly conserved transmembrane segments. In situ hybridization revealed that mRNAs encoding these subunits are widely expressed in rat brain with distinct but overlapping patterns Austin et al. (1999) mapped this gene, which they referred to as human KCa3 (hKCa3), to 1q21 by radiation hybrid analysis. In the families from the National Institute of Mental Health (NIMH) Schizophrenia Genetics Initiative, they compared transmission to discordant sibs and parental transmission to affected offspring. Overall, there was no convincing evidence that KCNN3 CAG lengths differed between schizophrenics and controls. There was also no evidence of excessive parental transmission of long CAG repeat alleles to affected offspring. Sun et al. (2001) reported the genomic organization and a promoter analysis of the KCNN3 gene

[14702] Animal model experiments lend further support to the function of KCNN3. Bond et al. (2000) targeted the SK3

gene by homologous recombination for the insertion of a gene switch that permitted experimental regulation of SK3 expression while retaining normal SK3 promoter function. An absence of SK3 did not present overt phenotypic consequences. However, SK3 overexpression induced abnormal respiratory responses to hypoxia and compromised parturition, presumably by effects on uterine contraction. Both conditions were corrected by silencing the gene. Bond et al. (2000) concluded that their results implicate SK3 channels as potential therapeutic targets for disorders such as sleep apnea or sudden infant death syndrome and for regulating uterine contractions during labor.

[14703] It is appreciated that the abovementioned animal model for KCNN3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[14704] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14705] Sun, G.; Tomita, H.; Shakkottai, V. G.; Gargus, J. J. : Genomic organization and promoter analysis of human KCNN3 gene. J. Hum. Genet. 46: 463- 470, 2001. ; and

[14706] Bond, C. T.; Sprengel, R.; Bissonnette, J. M.; Kaufmann, W.

A.; Pribnow, D.; Neelands, T.; Storck, T.; Baetscher, M.; Jerecic, J.; Maylie, J.; Knaus, H.- G.; Seeburg, P. H.; Adelman, J.

[14707] Further studies establishing the function and utilities of KCNN3 are found in John Hopkins OMIM database record ID 602983, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium intermediate/small conductance calcium-activated channel, subfamily n, member 3 (KCNN3, Accession NP_002240.2) is another GAM94 target gene, herein designated TARGET GENE. KCNN3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNN3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNN3 BINDING SITE, designated SEQ ID:10793, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14708] Another function of GAM94 is therefore inhibition of Potassium intermediate/small conductance calcium-activated channel, subfamily n, member 3 (KCNN3, Accession NP_002240.2), a gene which forms a voltage- indepen-

dent potassium channel activated by intracellular calcium. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNN3.

[14709] The function of KCNN3 has been established by previous studies. Action potentials in vertebrate neurons are followed by an afterhyperpolarization (AHP) that may persist for several seconds and may have profound consequences for the firing pattern of the neuron. Each component of the AHP is kinetically distinct and is mediated by different calcium- activated potassium channels. SK channels are activated in a voltage- independent manner and have a relatively small unit conductance and high sensitivity to calcium. See 602754. Kohler et al. (1996) isolated rat and human brain cDNAs encoding a family of SK channels which they designated SK1 (KCNN1; 602982), SK2 (OMIM Ref. No. 605879), and SK3. All 3 proteins contain intracellular N and C termini and 6 highly conserved transmembrane segments. In situ hybridization revealed that mRNAs encoding these subunits are widely expressed in rat brain with distinct but overlapping patterns Austin et al. (1999) mapped this gene, which they referred to as human KCa3 (hKCa3), to 1q21 by radiation hybrid analysis.

In the families from the National Institute of Mental Health (NIMH) Schizophrenia Genetics Initiative, they compared transmission to discordant sibs and parental transmission to affected offspring. Overall, there was no convincing evidence that KCNN3 CAG lengths differed between schizophrenics and controls. There was also no evidence of excessive parental transmission of long CAG repeat alleles to affected offspring. Sun et al. (2001) reported the genomic organization and a promoter analysis of the KCNN3 gene

[14710] Animal model experiments lend further support to the function of KCNN3. Bond et al. (2000) targeted the SK3 gene by homologous recombination for the insertion of a gene switch that permitted experimental regulation of SK3 expression while retaining normal SK3 promoter function. An absence of SK3 did not present overt phenotypic consequences. However, SK3 overexpression induced abnormal respiratory responses to hypoxia and compromised parturition, presumably by effects on uterine contraction. Both conditions were corrected by silencing the gene. Bond et al. (2000) concluded that their results implicate SK3 channels as potential therapeutic targets for disorders such as sleep apnea or sudden infant death syndrome and

for regulating uterine contractions during labor.

[14711] It is appreciated that the abovementioned animal model for KCNN3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[14712] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14713] Sun, G.; Tomita, H.; Shakkottai, V. G.; Gargus, J. J. : Genomic organization and promoter analysis of human KCNN3 gene. J. Hum. Genet. 46: 463- 470, 2001. ; and

[14714] Bond, C. T.; Sprengel, R.; Bissonnette, J. M.; Kaufmann, W. A.; Pribnow, D.; Neelands, T.; Storck, T.; Baetscher, M.; Jerecic, J.; Maylie, J.; Knaus, H.- G.; Seeburg, P. H.; Adelman, J.

[14715] Further studies establishing the function and utilities of KCNN3 are found in John Hopkins OMIM database record ID 602983, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium voltage-gated channel, delayed-rectifier, subfamily s, member 2 (KCNS2, Accession XP_043106.1) is another GAM94 target gene, herein designated TARGET GENE. KCNS2 BINDING SITE is a target binding site found in the

3` untranslated region of mRNA encoded by KCNS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNS2 BINDING SITE, designated SEQ ID:7405, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14716] Another function of GAM94 is therefore inhibition of Potassium voltage-gated channel, delayed-rectifier, subfamily s, member 2 (KCNS2, Accession XP_043106.1), a gene which mediates the voltage- dependent potassium ion permeability of excitable membranes. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS2.

[14717] The function of KCNS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.1.KIAA0063 (Accession NP_055691.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA0063 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0063, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0063 BINDING SITE, designated SEQ ID:4542, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14718] Another function of GAM94 is therefore inhibition of KIAA0063 (Accession NP_055691.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0063.

[14719] KIAA0152 (Accession NP_055545.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA0152 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0152, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0152 BINDING SITE, designated SEQ ID:9197, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14720] Another function of GAM94 is therefore inhibition of KIAA0152 (Accession NP_055545.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KIAA0152.

[14721] KIAA0193 (Accession NP_055581.2) is another GAM94 target gene, herein designated TARGET GENE. KIAA0193 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0193, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0193 BINDING SITE, designated SEQ ID:18064, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14722] Another function of GAM94 is therefore inhibition of KIAA0193 (Accession NP_055581.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0193.

[14723] KIAA0237 (Accession NP_055562.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA0237 BINDING SITE1 and KIAA0237 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA0237, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE1 and KIAA0237 BINDING SITE2, designated SEQ ID:20043 and SEQ ID:19421 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14724] Another function of GAM94 is therefore inhibition of KIAA0237 (Accession NP_055562.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237.

[14725] KIAA0280 (Accession XP_166238.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA0280 BINDING SITE1 and KIAA0280 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA0280, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0280 BINDING SITE1 and KIAA0280 BINDING SITE2, designated SEQ ID:18800 and SEQ ID:16465 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14726] Another function of GAM94 is therefore inhibition of KIAA0280 (Accession XP_166238.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0280.

[14727] KIAA0303 (Accession XP_291141.2) is another GAM94 target gene, herein designated TARGET GENE. KIAA0303 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0303, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0303 BINDING SITE, designated SEQ ID:477, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14728] Another function of GAM94 is therefore inhibition of KIAA0303 (Accession XP_291141.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0303.

[14729] KIAA0375 (Accession XP_048462.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA0375 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA0375, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0375 BINDING SITE, designated SEQ ID:7737, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14730] Another function of GAM94 is therefore inhibition of KIAA0375 (Accession XP_048462.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0375.

[14731] KIAA0376 (Accession XP_037759.2) is another GAM94 target gene, herein designated TARGET GENE. KIAA0376 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0376, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0376 BINDING SITE, designated SEQ ID:19848, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14732] Another function of GAM94 is therefore inhibition of

KIAA0376 (Accession XP_037759.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0376.

[14733] KIAA0431 (Accession NP_056066.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA0431 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0431, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0431 BINDING SITE, designated SEQ ID:9717, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14734] Another function of GAM94 is therefore inhibition of KIAA0431 (Accession NP_056066.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0431.

[14735] KIAA0557 (Accession XP_085507.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA0557 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0557, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:19825, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14736] Another function of GAM94 is therefore inhibition of KIAA0557 (Accession XP_085507.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557.

[14737] KIAA0570 (Accession XP_291018.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA0570 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0570, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0570 BINDING SITE, designated SEQ ID:17900, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14738] Another function of GAM94 is therefore inhibition of KIAA0570 (Accession XP_291018.1) . Accordingly, utilities

of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0570.

[14739] KIAA0592 (Accession XP_170645.2) is another GAM94 target gene, herein designated TARGET GENE. KIAA0592 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0592, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0592 BINDING SITE, designated SEQ ID:3081, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14740] Another function of GAM94 is therefore inhibition of KIAA0592 (Accession XP_170645.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0592.

[14741] KIAA0922 (Accession NP_056011.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA0922 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0922, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0922 BINDING SITE, designated SEQ ID:9702, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14742] Another function of GAM94 is therefore inhibition of KIAA0922 (Accession NP_056011.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0922.

[14743] KIAA0934 (Accession XP_034536.4) is another GAM94 target gene, herein designated TARGET GENE. KIAA0934 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0934, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0934 BINDING SITE, designated SEQ ID:12863, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14744] Another function of GAM94 is therefore inhibition of KIAA0934 (Accession XP_034536.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KIAA0934.

[14745] KIAA1032 (Accession XP_038604.4) is another GAM94 target gene, herein designated TARGET GENE. KIAA1032 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1032, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1032 BINDING SITE, designated SEQ ID:11779, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14746] Another function of GAM94 is therefore inhibition of KIAA1032 (Accession XP_038604.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1032.

[14747] KIAA1076 (Accession XP_037523.6) is another GAM94 target gene, herein designated TARGET GENE. KIAA1076 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1076, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1076 BINDING SITE, designated SEQ ID:19836, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14748] Another function of GAM94 is therefore inhibition of KIAA1076 (Accession XP_037523.6) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1076.

[14749] KIAA1202 (Accession XP_050478.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA1202 BINDING SITE1 through KIAA1202 BINDING SITE4 are target binding sites found in untranslated regions of mRNA encoded by KIAA1202, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1202 BINDING SITE1 through KIAA1202 BINDING SITE4, designated SEQ ID:10637, SEQ ID:1445, SEQ ID:6664 and SEQ ID:11414 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14750] Another function of GAM94 is therefore inhibition of KIAA1202 (Accession XP_050478.1) . Accordingly, utilities

of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1202.

[14751] KIAA1210 (Accession XP_172801.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA1210 BINDING SITE1 and KIAA1210 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1210, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1210 BINDING SITE1 and KIAA1210 BINDING SITE2, designated SEQ ID:2528 and SEQ ID:15805 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14752] Another function of GAM94 is therefore inhibition of KIAA1210 (Accession XP_172801.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1210.

[14753] KIAA1376 (Accession XP_033042.2) is another GAM94 target gene, herein designated TARGET GENE. KIAA1376 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1376, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1376 BINDING SITE, designated SEQ ID:15428, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14754] Another function of GAM94 is therefore inhibition of KIAA1376 (Accession XP_033042.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1376.

[14755] KIAA1399 (Accession XP_046685.4) is another GAM94 target gene, herein designated TARGET GENE. KIAA1399 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1399, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1399 BINDING SITE, designated SEQ ID:9460, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14756] Another function of GAM94 is therefore inhibition of

KIAA1399 (Accession XP_046685.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1399.

[14757] KIAA1416 (Accession XP_098762.3) is another GAM94 target gene, herein designated TARGET GENE. KIAA1416 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1416, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:12761, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14758] Another function of GAM94 is therefore inhibition of KIAA1416 (Accession XP_098762.3) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416.

[14759] KIAA1447 (Accession XP_290770.2) is another GAM94 target gene, herein designated TARGET GENE. KIAA1447 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1447, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1447 BINDING SITE, designated SEQ ID:754, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14760] Another function of GAM94 is therefore inhibition of KIAA1447 (Accession XP_290770.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1447.

[14761] KIAA1550 (Accession XP_039393.3) is another GAM94 target gene, herein designated TARGET GENE. KIAA1550 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1550, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:16791, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14762] Another function of GAM94 is therefore inhibition of KIAA1550 (Accession XP_039393.3) . Accordingly, utilities

of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1550.

[14763] KIAA1684 (Accession XP_290806.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA1684 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1684, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1684 BINDING SITE, designated SEQ ID:14267, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14764] Another function of GAM94 is therefore inhibition of KIAA1684 (Accession XP_290806.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1684.

[14765] KIAA1729 (Accession XP_114418.2) is another GAM94 target gene, herein designated TARGET GENE. KIAA1729 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1729, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1729 BINDING SITE, designated SEQ ID:12326, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14766] Another function of GAM94 is therefore inhibition of KIAA1729 (Accession XP_114418.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1729.

[14767] KIAA1731 (Accession XP_290545.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA1731 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1731, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1731 BINDING SITE, designated SEQ ID:6800, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14768] Another function of GAM94 is therefore inhibition of KIAA1731 (Accession XP_290545.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KIAA1731.

[14769] KIAA1735 (Accession XP_290496.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA1735 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1735, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1735 BINDING SITE, designated SEQ ID:12832, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14770] Another function of GAM94 is therefore inhibition of KIAA1735 (Accession XP_290496.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1735.

[14771] KIAA1827 (Accession XP_290834.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA1827 BINDING SITE1 and KIAA1827 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1827, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1827 BINDING SITE1 and KIAA1827 BINDING SITE2, designated SEQ ID:6984 and SEQ ID:5677 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14772] Another function of GAM94 is therefore inhibition of KIAA1827 (Accession XP_290834.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1827.

[14773] KIAA1853 (Accession XP_045184.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA1853 BINDING SITE1 and KIAA1853 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1853, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1853 BINDING SITE1 and KIAA1853 BINDING SITE2, designated SEQ ID:10772 and SEQ ID:4894 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14774] Another function of GAM94 is therefore inhibition of KIAA1853 (Accession XP_045184.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1853.

[14775] KIAA1870 (Accession NP_115537.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA1870 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA1870, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1870 BINDING SITE, designated SEQ ID:17798, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14776] Another function of GAM94 is therefore inhibition of KIAA1870 (Accession NP_115537.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1870.

[14777] KIAA2001 (Accession XP_291322.1) is another GAM94 target gene, herein designated TARGET GENE. KIAA2001 BINDING SITE1 and KIAA2001 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by KIAA2001, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA2001 BINDING SITE1 and KIAA2001 BINDING SITE2, designated SEQ ID:3364 and SEQ ID:19659 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14778] Another function of GAM94 is therefore inhibition of KIAA2001 (Accession XP_291322.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA2001.

[14779] KR18 (Accession NP_150630.1) is another GAM94 target gene, herein designated TARGET GENE. KR18 BINDING SITE1 through KR18 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by KR18, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KR18 BINDING SITE1 through KR18 BINDING SITE3, designated SEQ ID:8750, SEQ ID:16888 and SEQ

ID:5169 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14780] Another function of GAM94 is therefore inhibition of KR18 (Accession NP_150630.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KR18.

[14781] LANO (Accession NP_060684.1) is another GAM94 target gene, herein designated TARGET GENE. LANO BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LANO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LANO BINDING SITE, designated SEQ ID:2628, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14782] Another function of GAM94 is therefore inhibition of LANO (Accession NP_060684.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANO.

[14783] Lag1 longevity assurance homolog 2 (s. cerevisiae) (LASS2, Accession NP_037516.2) is another GAM94 target

gene, herein designated TARGET GENE. LASS2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LASS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LASS2 BINDING SITE, designated SEQ ID:1787, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14784] Another function of GAM94 is therefore inhibition of Lag1 longevity assurance homolog 2 (s. cerevisiae) (LASS2, Accession NP_037516.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASS2.

[14785] Leptin (obesity homolog, mouse) (LEP, Accession NP_000221.1) is another GAM94 target gene, herein designated TARGET GENE. LEP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LEP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LEP BINDING SITE, designated SEQ ID:8384, to the nucleotide sequence of GAM94 RNA,

herein designated GAM RNA, also designated SEQ ID:332.

[14786] Another function of GAM94 is therefore inhibition of Leptin (obesity homolog, mouse) (LEP, Accession NP_000221.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEP.

[14787] Leucine-rich repeat lgi family, member 4 (LGI4, Accession NP_644813.1) is another GAM94 target gene, herein designated TARGET GENE. LGI4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LGI4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LGI4 BINDING SITE, designated SEQ ID:18376, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14788] Another function of GAM94 is therefore inhibition of Leucine-rich repeat lgi family, member 4 (LGI4, Accession NP_644813.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGI4.

[14789] Leukemia inhibitory factor (cholinergic differentiation factor) (LIF, Accession NP_002300.1) is another GAM94 tar-

get gene, herein designated TARGET GENE. LIF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LIF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LIF BINDING SITE, designated SEQ ID:7255, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14790] Another function of GAM94 is therefore inhibition of Leukemia inhibitory factor (cholinergic differentiation factor) (LIF, Accession NP_002300.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIF.

[14791] Leukocyte immunoglobulin-like receptor, subfamily b (with tm and itim domains), member 1 (LILRB1, Accession NP_006660.1) is another GAM94 target gene, herein designated TARGET GENE. LILRB1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LILRB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LILRB1 BINDING SITE, designated

SEQ ID:9402, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14792] Another function of GAM94 is therefore inhibition of Leukocyte immunoglobulin-like receptor, subfamily b (with tm and itim domains), member 1 (LILRB1, Accession NP_006660.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LILRB1.

[14793] Lim domains containing 1 (LIMD1, Accession NP_055055.1) is another GAM94 target gene, herein designated TARGET GENE. LIMD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LIMD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LIMD1 BINDING SITE, designated SEQ ID:573, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14794] Another function of GAM94 is therefore inhibition of Lim domains containing 1 (LIMD1, Accession NP_055055.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMD1.

[14795] Lipase, member h (LIPH, Accession NP_640341.1) is another GAM94 target gene, herein designated TARGET GENE. LIPH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LIPH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LIPH BINDING SITE, designated SEQ ID:6330, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14796] Another function of GAM94 is therefore inhibition of Lipase, member h (LIPH, Accession NP_640341.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPH.

[14797] Lim domain only 7 (LMO7, Accession NP_056668.1) is another GAM94 target gene, herein designated TARGET GENE. LMO7 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LMO7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LMO7 BINDING SITE,

designated SEQ ID:2940, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14798] Another function of GAM94 is therefore inhibition of Lim domain only 7 (LMO7, Accession NP_056668.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMO7.

[14799] Lim domain only 7 (LMO7, Accession NP_056667.1) is another GAM94 target gene, herein designated TARGET GENE. LMO7 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LMO7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LMO7 BINDING SITE, designated SEQ ID:2940, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14800] Another function of GAM94 is therefore inhibition of Lim domain only 7 (LMO7, Accession NP_056667.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with LMO7.

[14801] Lim domain only 7 (LMO7, Accession NP_005349.2) is another GAM94 target gene, herein designated TARGET GENE. LMO7 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LMO7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LMO7 BINDING SITE, designated SEQ ID:2940, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14802] Another function of GAM94 is therefore inhibition of Lim domain only 7 (LMO7, Accession NP_005349.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMO7.

[14803] Leiomodin 3 (fetal) (LMOD3, Accession XP_067529.3) is another GAM94 target gene, herein designated TARGET GENE. LMOD3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LMOD3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LMOD3 BINDING SITE, designated SEQ ID:4830, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14804] Another function of GAM94 is therefore inhibition of Leiomodin 3 (fetal) (LMOD3, Accession XP_067529.3) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMOD3.

[14805] LOC114971 (Accession XP_054936.4) is another GAM94 target gene, herein designated TARGET GENE. LOC114971 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC114971, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC114971 BINDING SITE, designated SEQ ID:3594, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14806] Another function of GAM94 is therefore inhibition of LOC114971 (Accession XP_054936.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC114971.

[14807] LOC116071 (Accession NP_612465.2) is another GAM94 target gene, herein designated TARGET GENE. LOC116071 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC116071, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC116071 BINDING SITE, designated SEQ ID:6765, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14808] Another function of GAM94 is therefore inhibition of LOC116071 (Accession NP_612465.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116071.

[14809] LOC123264 (Accession XP_058693.1) is another GAM94 target gene, herein designated TARGET GENE. LOC123264 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC123264, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC123264 BINDING SITE, designated SEQ ID:9559, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14810] Another function of GAM94 is therefore inhibition of LOC123264 (Accession XP_058693.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123264.

[14811] LOC123397 (Accession XP_063630.4) is another GAM94 target gene, herein designated TARGET GENE. LOC123397 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC123397, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC123397 BINDING SITE, designated SEQ ID:8234, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14812] Another function of GAM94 is therefore inhibition of LOC123397 (Accession XP_063630.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123397.

[14813] LOC123876 (Accession XP_058743.4) is another GAM94 target gene, herein designated TARGET GENE. LOC123876 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC123876, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC123876 BINDING SITE, designated SEQ ID:15004, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14814] Another function of GAM94 is therefore inhibition of LOC123876 (Accession XP_058743.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123876.

[14815] LOC126782 (Accession XP_059080.1) is another GAM94 target gene, herein designated TARGET GENE. LOC126782 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126782, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126782 BINDING SITE, designated SEQ ID:8295, to

the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14816] Another function of GAM94 is therefore inhibition of LOC126782 (Accession XP_059080.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126782.

[14817] LOC131963 (Accession XP_067689.1) is another GAM94 target gene, herein designated TARGET GENE. LOC131963 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC131963, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC131963 BINDING SITE, designated SEQ ID:13672, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14818] Another function of GAM94 is therefore inhibition of LOC131963 (Accession XP_067689.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131963.

[14819] LOC135293 (Accession XP_072402.4) is another GAM94

target gene, herein designated TARGET GENE. LOC135293 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC135293, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC135293 BINDING SITE, designated SEQ ID:6631, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14820] Another function of GAM94 is therefore inhibition of LOC135293 (Accession XP_072402.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135293.

[14821] LOC135818 (Accession XP_059804.4) is another GAM94 target gene, herein designated TARGET GENE. LOC135818 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC135818, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC135818 BINDING SITE, designated SEQ ID:7298, to the nucleotide sequence of GAM94 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:332.

[14822] Another function of GAM94 is therefore inhibition of LOC135818 (Accession XP_059804.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135818.

[14823] LOC136345 (Accession XP_072455.2) is another GAM94 target gene, herein designated TARGET GENE. LOC136345 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC136345, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC136345 BINDING SITE, designated SEQ ID:6912, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14824] Another function of GAM94 is therefore inhibition of LOC136345 (Accession XP_072455.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136345.

[14825] LOC143146 (Accession XP_011844.4) is another GAM94 target gene, herein designated TARGET GENE. LOC143146

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC143146, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143146 BINDING SITE, designated SEQ ID:12827, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14826] Another function of GAM94 is therefore inhibition of LOC143146 (Accession XP_011844.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143146.

[14827] LOC143310 (Accession XP_084485.1) is another GAM94 target gene, herein designated TARGET GENE. LOC143310 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC143310, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143310 BINDING SITE, designated SEQ ID:16252, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14828] Another function of GAM94 is therefore inhibition of LOC143310 (Accession XP_084485.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143310.

[14829] LOC143381 (Accession XP_084501.1) is another GAM94 target gene, herein designated TARGET GENE. LOC143381 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC143381, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143381 BINDING SITE, designated SEQ ID:11353, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14830] Another function of GAM94 is therefore inhibition of LOC143381 (Accession XP_084501.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143381.

[14831] LOC144147 (Accession XP_049879.1) is another GAM94 target gene, herein designated TARGET GENE. LOC144147 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC144147, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144147 BINDING SITE, designated SEQ ID:16427, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14832] Another function of GAM94 is therefore inhibition of LOC144147 (Accession XP_049879.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144147.

[14833] LOC144698 (Accession XP_084939.1) is another GAM94 target gene, herein designated TARGET GENE. LOC144698 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144698, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144698 BINDING SITE, designated SEQ ID:11632, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14834] Another function of GAM94 is therefore inhibition of

LOC144698 (Accession XP_084939.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144698.

[14835] LOC144776 (Accession XP_084964.1) is another GAM94 target gene, herein designated TARGET GENE. LOC144776 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144776, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144776 BINDING SITE, designated SEQ ID:15562, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14836] Another function of GAM94 is therefore inhibition of LOC144776 (Accession XP_084964.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144776.

[14837] LOC145844 (Accession XP_085255.1) is another GAM94 target gene, herein designated TARGET GENE. LOC145844 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145844, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145844 BINDING SITE, designated SEQ ID:10944, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14838] Another function of GAM94 is therefore inhibition of LOC145844 (Accession XP_085255.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145844.

[14839] LOC146488 (Accession XP_047748.5) is another GAM94 target gene, herein designated TARGET GENE. LOC146488 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146488, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146488 BINDING SITE, designated SEQ ID:4919, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14840] Another function of GAM94 is therefore inhibition of LOC146488 (Accession XP_047748.5) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146488.

[14841] LOC146520 (Accession XP_085492.1) is another GAM94 target gene, herein designated TARGET GENE. LOC146520 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146520, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146520 BINDING SITE, designated SEQ ID:19003, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14842] Another function of GAM94 is therefore inhibition of LOC146520 (Accession XP_085492.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146520.

[14843] LOC146713 (Accession XP_097071.2) is another GAM94 target gene, herein designated TARGET GENE. LOC146713 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146713, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146713 BINDING SITE, designated SEQ ID:5569, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14844] Another function of GAM94 is therefore inhibition of LOC146713 (Accession XP_097071.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146713.

[14845] LOC146894 (Accession NP_660316.1) is another GAM94 target gene, herein designated TARGET GENE. LOC146894 BINDING SITE1 and LOC146894 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC146894, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146894 BINDING SITE1 and LOC146894 BINDING SITE2, designated SEQ ID:17315 and SEQ ID:1807 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14846] Another function of GAM94 is therefore inhibition of

LOC146894 (Accession NP_660316.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146894.

[14847] LOC146953 (Accession XP_085659.2) is another GAM94 target gene, herein designated TARGET GENE. LOC146953 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146953, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146953 BINDING SITE, designated SEQ ID:8227, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14848] Another function of GAM94 is therefore inhibition of LOC146953 (Accession XP_085659.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146953.

[14849] LOC147658 (Accession XP_085827.1) is another GAM94 target gene, herein designated TARGET GENE. LOC147658 BINDING SITE1 and LOC147658 BINDING SITE2 are target binding sites found in untranslated regions of mRNA en-

coded by LOC147658, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147658 BINDING SITE1 and LOC147658 BINDING SITE2, designated SEQ ID:5048 and SEQ ID:3916 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14850] Another function of GAM94 is therefore inhibition of LOC147658 (Accession XP_085827.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147658.

[14851] LOC148166 (Accession XP_086077.1) is another GAM94 target gene, herein designated TARGET GENE. LOC148166 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148166 BINDING SITE, designated SEQ ID:5237, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14852] Another function of GAM94 is therefore inhibition of LOC148166 (Accession XP_086077.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148166.

[14853] LOC148756 (Accession XP_097516.1) is another GAM94 target gene, herein designated TARGET GENE. LOC148756 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148756, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148756 BINDING SITE, designated SEQ ID:16045, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14854] Another function of GAM94 is therefore inhibition of LOC148756 (Accession XP_097516.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148756.

[14855] LOC149271 (Accession XP_086475.1) is another GAM94 target gene, herein designated TARGET GENE. LOC149271 BINDING SITE1 and LOC149271 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by LOC149271, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149271 BINDING SITE1 and LOC149271 BINDING SITE2, designated SEQ ID:3067 and SEQ ID:8920 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14856] Another function of GAM94 is therefore inhibition of LOC149271 (Accession XP_086475.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149271.

[14857] LOC149606 (Accession XP_086600.1) is another GAM94 target gene, herein designated TARGET GENE. LOC149606 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149606, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149606 BINDING SITE, designated SEQ ID:3591, to the nucleotide sequence of GAM94 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:332.

[14858] Another function of GAM94 is therefore inhibition of LOC149606 (Accession XP_086600.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149606.

[14859] LOC150862 (Accession XP_087029.1) is another GAM94 target gene, herein designated TARGET GENE. LOC150862 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150862, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150862 BINDING SITE, designated SEQ ID:11883, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14860] Another function of GAM94 is therefore inhibition of LOC150862 (Accession XP_087029.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150862.

[14861] LOC151623 (Accession XP_098096.5) is another GAM94 target gene, herein designated TARGET GENE. LOC151623

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151623, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151623 BINDING SITE, designated SEQ ID:11767, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14862] Another function of GAM94 is therefore inhibition of LOC151623 (Accession XP_098096.5) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151623.

[14863] LOC151871 (Accession NP_620170.1) is another GAM94 target gene, herein designated TARGET GENE. LOC151871 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151871, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151871 BINDING SITE, designated SEQ ID:1818, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14864] Another function of GAM94 is therefore inhibition of LOC151871 (Accession NP_620170.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151871.

[14865] LOC152922 (Accession XP_094100.4) is another GAM94 target gene, herein designated TARGET GENE. LOC152922 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152922 BINDING SITE, designated SEQ ID:6972, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14866] Another function of GAM94 is therefore inhibition of LOC152922 (Accession XP_094100.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152922.

[14867] LOC152924 (Accession XP_087560.1) is another GAM94 target gene, herein designated TARGET GENE. LOC152924 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC152924, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152924 BINDING SITE, designated SEQ ID:17739, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14868] Another function of GAM94 is therefore inhibition of LOC152924 (Accession XP_087560.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152924.

[14869] LOC155081 (Accession XP_088145.2) is another GAM94 target gene, herein designated TARGET GENE. LOC155081 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC155081, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC155081 BINDING SITE, designated SEQ ID:1346, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14870] Another function of GAM94 is therefore inhibition of

LOC155081 (Accession XP_088145.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155081.

[14871] LOC157273 (Accession XP_098743.1) is another GAM94 target gene, herein designated TARGET GENE. LOC157273 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157273, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157273 BINDING SITE, designated SEQ ID:12456, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14872] Another function of GAM94 is therefore inhibition of LOC157273 (Accession XP_098743.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157273.

[14873] LOC157376 (Accession XP_088301.1) is another GAM94 target gene, herein designated TARGET GENE. LOC157376 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC157376, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157376 BINDING SITE, designated SEQ ID:16253, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14874] Another function of GAM94 is therefore inhibition of LOC157376 (Accession XP_088301.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157376.

[14875] LOC157858 (Accession XP_098833.2) is another GAM94 target gene, herein designated TARGET GENE. LOC157858 BINDING SITE1 and LOC157858 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC157858, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157858 BINDING SITE1 and LOC157858 BINDING SITE2, designated SEQ ID:19502 and SEQ ID:3986 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14876] Another function of GAM94 is therefore inhibition of LOC157858 (Accession XP_098833.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157858.

[14877] LOC158130 (Accession XP_044880.1) is another GAM94 target gene, herein designated TARGET GENE. LOC158130 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158130, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158130 BINDING SITE, designated SEQ ID:12067, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14878] Another function of GAM94 is therefore inhibition of LOC158130 (Accession XP_044880.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158130.

[14879] LOC158435 (Accession NP_612506.1) is another GAM94 target gene, herein designated TARGET GENE. LOC158435 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC158435, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158435 BINDING SITE, designated SEQ ID:14942, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14880] Another function of GAM94 is therefore inhibition of LOC158435 (Accession NP_612506.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158435.

[14881] LOC159036 (Accession XP_099018.1) is another GAM94 target gene, herein designated TARGET GENE. LOC159036 BINDING SITE1 and LOC159036 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC159036, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC159036 BINDING SITE1 and LOC159036 BINDING SITE2, designated SEQ ID:5842 and SEQ ID:12457 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also

designated SEQ ID:332.

[14882] Another function of GAM94 is therefore inhibition of LOC159036 (Accession XP_099018.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159036.

[14883] LOC159184 (Accession XP_010658.4) is another GAM94 target gene, herein designated TARGET GENE. LOC159184 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC159184, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC159184 BINDING SITE, designated SEQ ID:11617, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14884] Another function of GAM94 is therefore inhibition of LOC159184 (Accession XP_010658.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159184.

[14885] LOC162952 (Accession XP_091891.4) is another GAM94 target gene, herein designated TARGET GENE. LOC162952

BINDING SITE1 and LOC162952 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC162952, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC162952 BINDING SITE1 and LOC162952 BINDING SITE2, designated SEQ ID:9818 and SEQ ID:4321 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14886] Another function of GAM94 is therefore inhibition of LOC162952 (Accession XP_091891.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162952.

[14887] LOC169924 (Accession XP_092983.4) is another GAM94 target gene, herein designated TARGET GENE. LOC169924 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC169924, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC169924 BINDING SITE, designated SEQ ID:18410, to

the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14888] Another function of GAM94 is therefore inhibition of LOC169924 (Accession XP_092983.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169924.

[14889] LOC197317 (Accession XP_117014.1) is another GAM94 target gene, herein designated TARGET GENE. LOC197317 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC197317, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197317 BINDING SITE, designated SEQ ID:12560, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14890] Another function of GAM94 is therefore inhibition of LOC197317 (Accession XP_117014.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197317.

[14891] LOC197342 (Accession XP_113869.1) is another GAM94

target gene, herein designated TARGET GENE. LOC197342 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197342, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197342 BINDING SITE, designated SEQ ID:15635, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14892] Another function of GAM94 is therefore inhibition of LOC197342 (Accession XP_113869.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197342.

[14893] LOC200420 (Accession NP_660343.1) is another GAM94 target gene, herein designated TARGET GENE. LOC200420 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200420, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200420 BINDING SITE, designated SEQ ID:14717, to the nucleotide sequence of GAM94 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:332.

[14894] Another function of GAM94 is therefore inhibition of LOC200420 (Accession NP_660343.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200420.

[14895] LOC201158 (Accession NP_660344.1) is another GAM94 target gene, herein designated TARGET GENE. LOC201158 BINDING SITE1 and LOC201158 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC201158, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201158 BINDING SITE1 and LOC201158 BINDING SITE2, designated SEQ ID:886 and SEQ ID:2274 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14896] Another function of GAM94 is therefore inhibition of LOC201158 (Accession NP_660344.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201158.

[14897] LOC201164 (Accession NP_849158.1) is another GAM94 target gene, herein designated TARGET GENE. LOC201164 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC201164, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201164 BINDING SITE, designated SEQ ID:1481, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14898] Another function of GAM94 is therefore inhibition of LOC201164 (Accession NP_849158.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201164.

[14899] LOC201164 (Accession XP_290750.1) is another GAM94 target gene, herein designated TARGET GENE. LOC201164 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC201164, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of LOC201164 BINDING SITE, designated SEQ ID:1481, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14900] Another function of GAM94 is therefore inhibition of LOC201164 (Accession XP_290750.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201164.

[14901] LOC201617 (Accession XP_117315.1) is another GAM94 target gene, herein designated TARGET GENE. LOC201617 BINDING SITE1 and LOC201617 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC201617, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201617 BINDING SITE1 and LOC201617 BINDING SITE2, designated SEQ ID:12689 and SEQ ID:5425 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14902] Another function of GAM94 is therefore inhibition of LOC201617 (Accession XP_117315.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201617.

[14903] LOC203413 (Accession XP_117548.1) is another GAM94 target gene, herein designated TARGET GENE. LOC203413 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC203413, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC203413 BINDING SITE, designated SEQ ID:16230, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14904] Another function of GAM94 is therefore inhibition of LOC203413 (Accession XP_117548.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203413.

[14905] LOC203859 (Accession XP_115009.3) is another GAM94 target gene, herein designated TARGET GENE. LOC203859 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC203859, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC203859 BINDING SITE, designated SEQ ID:7325, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14906] Another function of GAM94 is therefore inhibition of LOC203859 (Accession XP_115009.3) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203859.

[14907] LOC220070 (Accession NP_660351.1) is another GAM94 target gene, herein designated TARGET GENE. LOC220070 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220070, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220070 BINDING SITE, designated SEQ ID:19843, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14908] Another function of GAM94 is therefore inhibition of LOC220070 (Accession NP_660351.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC220070.

[14909] LOC220763 (Accession XP_055551.1) is another GAM94 target gene, herein designated TARGET GENE. LOC220763 BINDING SITE1 and LOC220763 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC220763, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220763 BINDING SITE1 and LOC220763 BINDING SITE2, designated SEQ ID:18116 and SEQ ID:14370 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14910] Another function of GAM94 is therefore inhibition of LOC220763 (Accession XP_055551.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220763.

[14911] LOC221218 (Accession XP_166281.3) is another GAM94 target gene, herein designated TARGET GENE. LOC221218 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221218, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221218 BINDING SITE, designated SEQ ID:19455, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14912] Another function of GAM94 is therefore inhibition of LOC221218 (Accession XP_166281.3) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221218.

[14913] LOC221576 (Accession XP_168088.1) is another GAM94 target gene, herein designated TARGET GENE. LOC221576 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221576, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221576 BINDING SITE, designated SEQ ID:11589, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14914] Another function of GAM94 is therefore inhibition of LOC221576 (Accession XP_168088.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221576.

[14915] LOC221711 (Accession XP_166411.1) is another GAM94 target gene, herein designated TARGET GENE. LOC221711 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221711, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221711 BINDING SITE, designated SEQ ID:9150, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14916] Another function of GAM94 is therefore inhibition of LOC221711 (Accession XP_166411.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221711.

[14917] LOC221922 (Accession XP_166555.2) is another GAM94 target gene, herein designated TARGET GENE. LOC221922 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221922, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221922 BINDING SITE, designated SEQ ID:7052, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14918] Another function of GAM94 is therefore inhibition of LOC221922 (Accession XP_166555.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221922.

[14919] LOC221931 (Accession XP_168348.1) is another GAM94 target gene, herein designated TARGET GENE. LOC221931 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221931, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221931 BINDING SITE, designated SEQ ID:4736, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14920] Another function of GAM94 is therefore inhibition of LOC221931 (Accession XP_168348.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC221931.

[14921] LOC221981 (Accession XP_168344.1) is another GAM94 target gene, herein designated TARGET GENE. LOC221981 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221981, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221981 BINDING SITE, designated SEQ ID:9228, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14922] Another function of GAM94 is therefore inhibition of LOC221981 (Accession XP_168344.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221981.

[14923] LOC222699 (Accession XP_291197.1) is another GAM94 target gene, herein designated TARGET GENE. LOC222699 BINDING SITE1 and LOC222699 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC222699, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222699 BINDING SITE1 and LOC222699 BINDING SITE2, designated SEQ ID:16962 and SEQ ID:8126 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14924] Another function of GAM94 is therefore inhibition of LOC222699 (Accession XP_291197.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222699.

[14925] LOC253148 (Accession XP_173032.1) is another GAM94 target gene, herein designated TARGET GENE. LOC253148 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC253148, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253148 BINDING SITE, designated SEQ ID:6000, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14926] Another function of GAM94 is therefore inhibition of LOC253148 (Accession XP_173032.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253148.

[14927] LOC253805 (Accession XP_172854.1) is another GAM94 target gene, herein designated TARGET GENE. LOC253805 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC253805, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253805 BINDING SITE, designated SEQ ID:10542, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14928] Another function of GAM94 is therefore inhibition of LOC253805 (Accession XP_172854.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253805.

[14929] LOC253839 (Accession XP_170875.1) is another GAM94 target gene, herein designated TARGET GENE. LOC253839 BINDING SITE1 and LOC253839 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC253839, corresponding to target binding

sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253839 BINDING SITE1 and LOC253839 BINDING SITE2, designated SEQ ID:4687 and SEQ ID:17089 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14930] Another function of GAM94 is therefore inhibition of LOC253839 (Accession XP_170875.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253839.

[14931] LOC253982 (Accession XP_170804.3) is another GAM94 target gene, herein designated TARGET GENE. LOC253982 BINDING SITE1 and LOC253982 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC253982, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253982 BINDING SITE1 and LOC253982 BINDING SITE2, designated SEQ ID:17182 and SEQ ID:2355 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:332.

[14932] Another function of GAM94 is therefore inhibition of LOC253982 (Accession XP_170804.3) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253982.

[14933] LOC253992 (Accession XP_172953.2) is another GAM94 target gene, herein designated TARGET GENE. LOC253992 BINDING SITE1 and LOC253992 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC253992, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253992 BINDING SITE1 and LOC253992 BINDING SITE2, designated SEQ ID:12822 and SEQ ID:19414 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14934] Another function of GAM94 is therefore inhibition of LOC253992 (Accession XP_172953.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253992.

[14935] LOC255849 (Accession XP_172855.1) is another GAM94 target gene, herein designated TARGET GENE. LOC255849 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255849, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255849 BINDING SITE, designated SEQ ID:7005, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14936] Another function of GAM94 is therefore inhibition of LOC255849 (Accession XP_172855.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255849.

[14937] LOC256614 (Accession XP_172864.1) is another GAM94 target gene, herein designated TARGET GENE. LOC256614 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC256614, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256614 BINDING SITE, designated SEQ ID:1367, to

the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14938] Another function of GAM94 is therefore inhibition of LOC256614 (Accession XP_172864.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256614.

[14939] LOC257358 (Accession XP_173138.1) is another GAM94 target gene, herein designated TARGET GENE. LOC257358 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC257358, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257358 BINDING SITE, designated SEQ ID:2994, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14940] Another function of GAM94 is therefore inhibition of LOC257358 (Accession XP_173138.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257358.

[14941] LOC282888 (Accession XP_212605.1) is another GAM94

target gene, herein designated TARGET GENE. LOC282888 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC282888, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282888 BINDING SITE, designated SEQ ID:11589, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14942] Another function of GAM94 is therefore inhibition of LOC282888 (Accession XP_212605.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282888.

[14943] LOC282926 (Accession XP_212646.1) is another GAM94 target gene, herein designated TARGET GENE. LOC282926 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC282926, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282926 BINDING SITE, designated SEQ ID:11589, to the nucleotide sequence of GAM94 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:332.

[14944] Another function of GAM94 is therefore inhibition of LOC282926 (Accession XP_212646.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282926.

[14945] LOC282986 (Accession XP_208469.1) is another GAM94 target gene, herein designated TARGET GENE. LOC282986 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC282986, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282986 BINDING SITE, designated SEQ ID:15064, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14946] Another function of GAM94 is therefore inhibition of LOC282986 (Accession XP_208469.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282986.

[14947] LOC283010 (Accession XP_210848.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283010

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283010, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283010 BINDING SITE, designated SEQ ID:1988, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14948] Another function of GAM94 is therefore inhibition of LOC283010 (Accession XP_210848.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283010.

[14949] LOC283032 (Accession XP_208489.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283032 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283032, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283032 BINDING SITE, designated SEQ ID:10557, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14950] Another function of GAM94 is therefore inhibition of LOC283032 (Accession XP_208489.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283032.

[14951] LOC283047 (Accession XP_210870.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283047 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283047, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283047 BINDING SITE, designated SEQ ID:3684, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14952] Another function of GAM94 is therefore inhibition of LOC283047 (Accession XP_210870.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283047.

[14953] LOC283053 (Accession XP_210869.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283053 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC283053, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283053 BINDING SITE, designated SEQ ID:1988, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14954] Another function of GAM94 is therefore inhibition of LOC283053 (Accession XP_210869.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283053.

[14955] LOC283129 (Accession XP_208524.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283129 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283129, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283129 BINDING SITE, designated SEQ ID:16555, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14956] Another function of GAM94 is therefore inhibition of

LOC283129 (Accession XP_208524.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283129.

[14957] LOC283167 (Accession XP_210921.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283167 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283167, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283167 BINDING SITE, designated SEQ ID:9978, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14958] Another function of GAM94 is therefore inhibition of LOC283167 (Accession XP_210921.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283167.

[14959] LOC283194 (Accession XP_210932.2) is another GAM94 target gene, herein designated TARGET GENE. LOC283194 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283194, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283194 BINDING SITE, designated SEQ ID:15353, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14960] Another function of GAM94 is therefore inhibition of LOC283194 (Accession XP_210932.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283194.

[14961] LOC283314 (Accession XP_210969.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283314 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283314, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283314 BINDING SITE, designated SEQ ID:13566, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14962] Another function of GAM94 is therefore inhibition of LOC283314 (Accession XP_210969.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283314.

[14963] LOC283315 (Accession XP_210974.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283315 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283315, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283315 BINDING SITE, designated SEQ ID:19603, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14964] Another function of GAM94 is therefore inhibition of LOC283315 (Accession XP_210974.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283315.

[14965] LOC283329 (Accession XP_210978.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283329 BINDING SITE1 and LOC283329 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC283329, corresponding to target binding

sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283329 BINDING SITE1 and LOC283329 BINDING SITE2, designated SEQ ID:3885 and SEQ ID:2261 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14966] Another function of GAM94 is therefore inhibition of LOC283329 (Accession XP_210978.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283329.

[14967] LOC283381 (Accession XP_211006.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283381 BINDING SITE1 and LOC283381 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC283381, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283381 BINDING SITE1 and LOC283381 BINDING SITE2, designated SEQ ID:18381 and SEQ ID:10870 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also

designated SEQ ID:332.

[14968] Another function of GAM94 is therefore inhibition of LOC283381 (Accession XP_211006.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283381.

[14969] LOC283423 (Accession XP_211031.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283423 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283423, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283423 BINDING SITE, designated SEQ ID:11385, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14970] Another function of GAM94 is therefore inhibition of LOC283423 (Accession XP_211031.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283423.

[14971] LOC283439 (Accession XP_211039.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283439

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283439, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283439 BINDING SITE, designated SEQ ID:15116, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14972] Another function of GAM94 is therefore inhibition of LOC283439 (Accession XP_211039.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283439.

[14973] LOC283558 (Accession XP_208101.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283558 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283558, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283558 BINDING SITE, designated SEQ ID:12690, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14974] Another function of GAM94 is therefore inhibition of LOC283558 (Accession XP_208101.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283558.

[14975] LOC283639 (Accession XP_211135.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283639 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283639, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283639 BINDING SITE, designated SEQ ID:2425, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14976] Another function of GAM94 is therefore inhibition of LOC283639 (Accession XP_211135.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283639.

[14977] LOC283667 (Accession XP_211149.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283667 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC283667, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283667 BINDING SITE, designated SEQ ID:18438, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14978] Another function of GAM94 is therefore inhibition of LOC283667 (Accession XP_211149.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283667.

[14979] LOC283717 (Accession XP_208798.2) is another GAM94 target gene, herein designated TARGET GENE. LOC283717 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283717, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283717 BINDING SITE, designated SEQ ID:6827, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14980] Another function of GAM94 is therefore inhibition of

LOC283717 (Accession XP_208798.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283717.

[14981] LOC283738 (Accession XP_211186.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283738 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283738, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283738 BINDING SITE, designated SEQ ID:15870, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14982] Another function of GAM94 is therefore inhibition of LOC283738 (Accession XP_211186.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283738.

[14983] LOC283743 (Accession XP_208815.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283743 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283743, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283743 BINDING SITE, designated SEQ ID:14856, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14984] Another function of GAM94 is therefore inhibition of LOC283743 (Accession XP_208815.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283743.

[14985] LOC283767 (Accession XP_208835.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283767 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283767, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283767 BINDING SITE, designated SEQ ID:8147, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14986] Another function of GAM94 is therefore inhibition of LOC283767 (Accession XP_208835.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283767.

[14987] LOC283834 (Accession XP_211225.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283834 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283834, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283834 BINDING SITE, designated SEQ ID:632, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14988] Another function of GAM94 is therefore inhibition of LOC283834 (Accession XP_211225.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283834.

[14989] LOC283894 (Accession XP_211250.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283894 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283894, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283894 BINDING SITE, designated SEQ ID:6537, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14990] Another function of GAM94 is therefore inhibition of LOC283894 (Accession XP_211250.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283894.

[14991] LOC283909 (Accession XP_211256.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283909 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283909, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283909 BINDING SITE, designated SEQ ID:19947, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14992] Another function of GAM94 is therefore inhibition of LOC283909 (Accession XP_211256.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC283909.

[14993] LOC283963 (Accession XP_211275.2) is another GAM94 target gene, herein designated TARGET GENE. LOC283963 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283963, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283963 BINDING SITE, designated SEQ ID:9286, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14994] Another function of GAM94 is therefore inhibition of LOC283963 (Accession XP_211275.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283963.

[14995] LOC283993 (Accession XP_211293.1) is another GAM94 target gene, herein designated TARGET GENE. LOC283993 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283993, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC283993 BINDING SITE, designated SEQ ID:11731, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14996] Another function of GAM94 is therefore inhibition of LOC283993 (Accession XP_211293.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283993.

[14997] LOC284036 (Accession XP_211306.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284036 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284036, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284036 BINDING SITE, designated SEQ ID:16812, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[14998] Another function of GAM94 is therefore inhibition of LOC284036 (Accession XP_211306.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC284036.

[14999] LOC284093 (Accession XP_211331.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284093 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284093, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284093 BINDING SITE, designated SEQ ID:13458, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15000] Another function of GAM94 is therefore inhibition of LOC284093 (Accession XP_211331.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284093.

[15001] LOC284106 (Accession XP_209004.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284106 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284106, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC284106 BINDING SITE, designated SEQ ID:3622, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15002] Another function of GAM94 is therefore inhibition of LOC284106 (Accession XP_209004.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284106.

[15003] LOC284109 (Accession XP_211330.2) is another GAM94 target gene, herein designated TARGET GENE. LOC284109 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284109, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284109 BINDING SITE, designated SEQ ID:12668, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15004] Another function of GAM94 is therefore inhibition of LOC284109 (Accession XP_211330.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284109.

[15005] LOC284158 (Accession XP_209041.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284158 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284158, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284158 BINDING SITE, designated SEQ ID:14340, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15006] Another function of GAM94 is therefore inhibition of LOC284158 (Accession XP_209041.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284158.

[15007] LOC284166 (Accession XP_209050.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284166 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284166 BINDING SITE, designated SEQ ID:574, to

the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15008] Another function of GAM94 is therefore inhibition of LOC284166 (Accession XP_209050.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284166.

[15009] LOC284171 (Accession XP_209051.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284171 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284171, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284171 BINDING SITE, designated SEQ ID:4956, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15010] Another function of GAM94 is therefore inhibition of LOC284171 (Accession XP_209051.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284171.

[15011] LOC284185 (Accession XP_209062.2) is another GAM94

target gene, herein designated TARGET GENE. LOC284185 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284185, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284185 BINDING SITE, designated SEQ ID:11838, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15012] Another function of GAM94 is therefore inhibition of LOC284185 (Accession XP_209062.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284185.

[15013] LOC284200 (Accession XP_209065.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284200 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284200, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284200 BINDING SITE, designated SEQ ID:14624, to the nucleotide sequence of GAM94 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:332.

[15014] Another function of GAM94 is therefore inhibition of LOC284200 (Accession XP_209065.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284200.

[15015] LOC284277 (Accession XP_209102.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284277 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284277, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284277 BINDING SITE, designated SEQ ID:11892, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15016] Another function of GAM94 is therefore inhibition of LOC284277 (Accession XP_209102.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284277.

[15017] LOC284281 (Accession XP_211415.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284281

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284281, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284281 BINDING SITE, designated SEQ ID:12346, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15018] Another function of GAM94 is therefore inhibition of LOC284281 (Accession XP_211415.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284281.

[15019] LOC284313 (Accession XP_209116.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284313 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284313, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284313 BINDING SITE, designated SEQ ID:911, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15020] Another function of GAM94 is therefore inhibition of LOC284313 (Accession XP_209116.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284313.

[15021] LOC284361 (Accession NP_778233.2) is another GAM94 target gene, herein designated TARGET GENE. LOC284361 BINDING SITE1 and LOC284361 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC284361, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284361 BINDING SITE1 and LOC284361 BINDING SITE2, designated SEQ ID:2133 and SEQ ID:7597 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15022] Another function of GAM94 is therefore inhibition of LOC284361 (Accession NP_778233.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284361.

[15023] LOC284514 (Accession XP_209244.1) is another GAM94

target gene, herein designated TARGET GENE. LOC284514 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284514, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284514 BINDING SITE, designated SEQ ID:7648, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15024] Another function of GAM94 is therefore inhibition of LOC284514 (Accession XP_209244.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284514.

[15025] LOC284526 (Accession XP_211508.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284526 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284526, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284526 BINDING SITE, designated SEQ ID:4914, to the nucleotide sequence of GAM94 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:332.

[15026] Another function of GAM94 is therefore inhibition of LOC284526 (Accession XP_211508.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284526.

[15027] LOC284584 (Accession XP_211528.3) is another GAM94 target gene, herein designated TARGET GENE. LOC284584 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284584, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284584 BINDING SITE, designated SEQ ID:13941, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15028] Another function of GAM94 is therefore inhibition of LOC284584 (Accession XP_211528.3) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284584.

[15029] LOC284612 (Accession XP_211551.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284612

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284612, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284612 BINDING SITE, designated SEQ ID:9049, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15030] Another function of GAM94 is therefore inhibition of LOC284612 (Accession XP_211551.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284612.

[15031] LOC284621 (Accession XP_208227.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284621 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284621, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284621 BINDING SITE, designated SEQ ID:8361, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15032] Another function of GAM94 is therefore inhibition of LOC284621 (Accession XP_208227.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284621.

[15033] LOC284647 (Accession XP_211569.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284647 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284647, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284647 BINDING SITE, designated SEQ ID:7303, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15034] Another function of GAM94 is therefore inhibition of LOC284647 (Accession XP_211569.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284647.

[15035] LOC284665 (Accession XP_211581.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284665 BINDING SITE1 and LOC284665 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by LOC284665, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284665 BINDING SITE1 and LOC284665 BINDING SITE2, designated SEQ ID:2955 and SEQ ID:10092 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15036] Another function of GAM94 is therefore inhibition of LOC284665 (Accession XP_211581.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284665.

[15037] LOC284669 (Accession XP_211584.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284669 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284669, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284669 BINDING SITE, designated SEQ ID:16579, to the nucleotide sequence of GAM94 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:332.

[15038] Another function of GAM94 is therefore inhibition of LOC284669 (Accession XP_211584.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284669.

[15039] LOC284671 (Accession XP_209313.2) is another GAM94 target gene, herein designated TARGET GENE. LOC284671 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284671, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284671 BINDING SITE, designated SEQ ID:11553, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15040] Another function of GAM94 is therefore inhibition of LOC284671 (Accession XP_209313.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284671.

[15041] LOC284751 (Accession XP_211622.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284751

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284751, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284751 BINDING SITE, designated SEQ ID:2392, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15042] Another function of GAM94 is therefore inhibition of LOC284751 (Accession XP_211622.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284751.

[15043] LOC284810 (Accession XP_209368.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284810 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284810, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284810 BINDING SITE, designated SEQ ID:8984, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15044] Another function of GAM94 is therefore inhibition of LOC284810 (Accession XP_209368.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284810.

[15045] LOC284851 (Accession XP_211667.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284851 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284851, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284851 BINDING SITE, designated SEQ ID:15871, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15046] Another function of GAM94 is therefore inhibition of LOC284851 (Accession XP_211667.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284851.

[15047] LOC284906 (Accession XP_209402.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284906 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC284906, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284906 BINDING SITE, designated SEQ ID:19372, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15048] Another function of GAM94 is therefore inhibition of LOC284906 (Accession XP_209402.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284906.

[15049] LOC284907 (Accession XP_209397.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284907 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284907, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284907 BINDING SITE, designated SEQ ID:15731, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15050] Another function of GAM94 is therefore inhibition of

LOC284907 (Accession XP_209397.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284907.

[15051] LOC284911 (Accession XP_211684.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284911 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284911, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284911 BINDING SITE, designated SEQ ID:11375, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15052] Another function of GAM94 is therefore inhibition of LOC284911 (Accession XP_211684.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284911.

[15053] LOC284925 (Accession XP_209414.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284925 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284925, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284925 BINDING SITE, designated SEQ ID:14715, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15054] Another function of GAM94 is therefore inhibition of LOC284925 (Accession XP_209414.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284925.

[15055] LOC284939 (Accession XP_211700.1) is another GAM94 target gene, herein designated TARGET GENE. LOC284939 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284939, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284939 BINDING SITE, designated SEQ ID:3044, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15056] Another function of GAM94 is therefore inhibition of LOC284939 (Accession XP_211700.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284939.

[15057] LOC285043 (Accession XP_211742.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285043 BINDING SITE1 and LOC285043 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC285043, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285043 BINDING SITE1 and LOC285043 BINDING SITE2, designated SEQ ID:1295 and SEQ ID:1869 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15058] Another function of GAM94 is therefore inhibition of LOC285043 (Accession XP_211742.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285043.

[15059] LOC285123 (Accession XP_211773.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285123 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC285123, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285123 BINDING SITE, designated SEQ ID:13262, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15060] Another function of GAM94 is therefore inhibition of LOC285123 (Accession XP_211773.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285123.

[15061] LOC285226 (Accession XP_209522.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285226 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285226, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285226 BINDING SITE, designated SEQ ID:4047, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15062] Another function of GAM94 is therefore inhibition of

LOC285226 (Accession XP_209522.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285226.

[15063] LOC285256 (Accession XP_211818.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285256 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285256, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285256 BINDING SITE, designated SEQ ID:19463, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15064] Another function of GAM94 is therefore inhibition of LOC285256 (Accession XP_211818.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285256.

[15065] LOC285283 (Accession XP_208017.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285283 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285283, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285283 BINDING SITE, designated SEQ ID:13463, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15066] Another function of GAM94 is therefore inhibition of LOC285283 (Accession XP_208017.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285283.

[15067] LOC285329 (Accession XP_209569.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285329 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285329, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285329 BINDING SITE, designated SEQ ID:3250, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15068] Another function of GAM94 is therefore inhibition of LOC285329 (Accession XP_209569.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285329.

[15069] LOC285359 (Accession XP_211858.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285359 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285359, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285359 BINDING SITE, designated SEQ ID:18819, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15070] Another function of GAM94 is therefore inhibition of LOC285359 (Accession XP_211858.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285359.

[15071] LOC285376 (Accession XP_211864.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285376 BINDING SITE1 and LOC285376 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC285376, corresponding to target binding

sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285376 BINDING SITE1 and LOC285376 BINDING SITE2, designated SEQ ID:4042 and SEQ ID:10455 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15072] Another function of GAM94 is therefore inhibition of LOC285376 (Accession XP_211864.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285376.

[15073] LOC285408 (Accession XP_211886.3) is another GAM94 target gene, herein designated TARGET GENE. LOC285408 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285408, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285408 BINDING SITE, designated SEQ ID:19174, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15074] Another function of GAM94 is therefore inhibition of

LOC285408 (Accession XP_211886.3) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285408.

[15075] LOC285561 (Accession XP_211940.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285561 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285561, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285561 BINDING SITE, designated SEQ ID:4265, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15076] Another function of GAM94 is therefore inhibition of LOC285561 (Accession XP_211940.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285561.

[15077] LOC285581 (Accession XP_211942.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285581 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285581, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285581 BINDING SITE, designated SEQ ID:2844, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15078] Another function of GAM94 is therefore inhibition of LOC285581 (Accession XP_211942.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285581.

[15079] LOC285593 (Accession XP_211944.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285593 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285593, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285593 BINDING SITE, designated SEQ ID:18196, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15080] Another function of GAM94 is therefore inhibition of LOC285593 (Accession XP_211944.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285593.

[15081] LOC285626 (Accession XP_211959.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285626 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285626, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285626 BINDING SITE, designated SEQ ID:11670, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15082] Another function of GAM94 is therefore inhibition of LOC285626 (Accession XP_211959.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285626.

[15083] LOC285719 (Accession XP_211990.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285719 BINDING SITE1 and LOC285719 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC285719, corresponding to target binding

sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285719 BINDING SITE1 and LOC285719 BINDING SITE2, designated SEQ ID:16194 and SEQ ID:13781 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15084] Another function of GAM94 is therefore inhibition of LOC285719 (Accession XP_211990.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285719.

[15085] LOC285727 (Accession XP_212000.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285727 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285727, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285727 BINDING SITE, designated SEQ ID:9830, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15086] Another function of GAM94 is therefore inhibition of

LOC285727 (Accession XP_212000.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285727.

[15087] LOC285737 (Accession XP_208346.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285737 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285737, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285737 BINDING SITE, designated SEQ ID:19245, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15088] Another function of GAM94 is therefore inhibition of LOC285737 (Accession XP_208346.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285737.

[15089] LOC285744 (Accession XP_209743.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285744 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285744, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285744 BINDING SITE, designated SEQ ID:14530, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15090] Another function of GAM94 is therefore inhibition of LOC285744 (Accession XP_209743.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285744.

[15091] LOC285769 (Accession XP_209755.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285769 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285769, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285769 BINDING SITE, designated SEQ ID:10416, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15092] Another function of GAM94 is therefore inhibition of LOC285769 (Accession XP_209755.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285769.

[15093] LOC285778 (Accession XP_209756.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285778 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285778, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285778 BINDING SITE, designated SEQ ID:3549, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15094] Another function of GAM94 is therefore inhibition of LOC285778 (Accession XP_209756.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285778.

[15095] LOC285781 (Accession XP_212018.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285781 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285781, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285781 BINDING SITE, designated SEQ ID:12982, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15096] Another function of GAM94 is therefore inhibition of LOC285781 (Accession XP_212018.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285781.

[15097] LOC285806 (Accession XP_212028.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285806 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285806, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285806 BINDING SITE, designated SEQ ID:3350, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15098] Another function of GAM94 is therefore inhibition of LOC285806 (Accession XP_212028.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC285806.

[15099] LOC285854 (Accession XP_209770.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285854 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285854, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285854 BINDING SITE, designated SEQ ID:10315, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15100] Another function of GAM94 is therefore inhibition of LOC285854 (Accession XP_209770.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285854.

[15101] LOC285933 (Accession XP_212102.1) is another GAM94 target gene, herein designated TARGET GENE. LOC285933 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285933, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC285933 BINDING SITE, designated SEQ ID:1456, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15102] Another function of GAM94 is therefore inhibition of LOC285933 (Accession XP_212102.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285933.

[15103] LOC286008 (Accession XP_212134.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286008 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286008, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286008 BINDING SITE, designated SEQ ID:7067, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15104] Another function of GAM94 is therefore inhibition of LOC286008 (Accession XP_212134.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC286008.

[15105] LOC286046 (Accession NP_775954.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286046 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286046, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286046 BINDING SITE, designated SEQ ID:2256, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15106] Another function of GAM94 is therefore inhibition of LOC286046 (Accession NP_775954.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286046.

[15107] LOC286059 (Accession XP_212156.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286059 BINDING SITE1 and LOC286059 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC286059, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of

the nucleotide sequences of LOC286059 BINDING SITE1 and LOC286059 BINDING SITE2, designated SEQ ID:5125 and SEQ ID:12587 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15108] Another function of GAM94 is therefore inhibition of LOC286059 (Accession XP_212156.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286059.

[15109] LOC286131 (Accession XP_210719.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286131 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286131, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286131 BINDING SITE, designated SEQ ID:20048, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15110] Another function of GAM94 is therefore inhibition of LOC286131 (Accession XP_210719.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC286131.

[15111] LOC286180 (Accession XP_212213.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286180 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286180, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286180 BINDING SITE, designated SEQ ID:17161, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15112] Another function of GAM94 is therefore inhibition of LOC286180 (Accession XP_212213.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286180.

[15113] LOC286188 (Accession XP_209933.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286188 BINDING SITE1 and LOC286188 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC286188, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286188 BINDING SITE1 and LOC286188 BINDING SITE2, designated SEQ ID:3917 and SEQ ID:12855 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15114] Another function of GAM94 is therefore inhibition of LOC286188 (Accession XP_209933.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286188.

[15115] LOC286206 (Accession XP_209953.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286206 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286206, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286206 BINDING SITE, designated SEQ ID:2441, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15116] Another function of GAM94 is therefore inhibition of LOC286206 (Accession XP_209953.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286206.

[15117] LOC286235 (Accession XP_212238.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286235 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286235, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286235 BINDING SITE, designated SEQ ID:15563, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15118] Another function of GAM94 is therefore inhibition of LOC286235 (Accession XP_212238.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286235.

[15119] LOC286359 (Accession XP_212288.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286359 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286359, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286359 BINDING SITE, designated SEQ ID:12006, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15120] Another function of GAM94 is therefore inhibition of LOC286359 (Accession XP_212288.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286359.

[15121] LOC286395 (Accession XP_212308.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286395 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286395, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286395 BINDING SITE, designated SEQ ID:7767, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15122] Another function of GAM94 is therefore inhibition of LOC286395 (Accession XP_212308.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC286395.

[15123] LOC286421 (Accession XP_212313.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286421 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286421, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286421 BINDING SITE, designated SEQ ID:15065, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15124] Another function of GAM94 is therefore inhibition of LOC286421 (Accession XP_212313.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286421.

[15125] LOC286430 (Accession XP_210044.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286430 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286430, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC286430 BINDING SITE, designated SEQ ID:9648, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15126] Another function of GAM94 is therefore inhibition of LOC286430 (Accession XP_210044.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286430.

[15127] LOC286448 (Accession XP_212322.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286448 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286448, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286448 BINDING SITE, designated SEQ ID:15291, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15128] Another function of GAM94 is therefore inhibition of LOC286448 (Accession XP_212322.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC286448.

[15129] LOC286449 (Accession XP_212321.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286449 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286449, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286449 BINDING SITE, designated SEQ ID:4136, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15130] Another function of GAM94 is therefore inhibition of LOC286449 (Accession XP_212321.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286449.

[15131] LOC286545 (Accession XP_208450.1) is another GAM94 target gene, herein designated TARGET GENE. LOC286545 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286545, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC286545 BINDING SITE, designated SEQ ID:1891, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15132] Another function of GAM94 is therefore inhibition of LOC286545 (Accession XP_208450.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286545.

[15133] LOC338562 (Accession XP_294654.1) is another GAM94 target gene, herein designated TARGET GENE. LOC338562 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338562, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338562 BINDING SITE, designated SEQ ID:20131, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15134] Another function of GAM94 is therefore inhibition of LOC338562 (Accession XP_294654.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338562.

[15135] LOC338607 (Accession XP_294661.1) is another GAM94 target gene, herein designated TARGET GENE. LOC338607 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338607, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338607 BINDING SITE, designated SEQ ID:7298, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15136] Another function of GAM94 is therefore inhibition of LOC338607 (Accession XP_294661.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338607.

[15137] LOC338707 (Accession XP_290534.1) is another GAM94 target gene, herein designated TARGET GENE. LOC338707 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338707, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338707 BINDING SITE, designated SEQ ID:16308, to

the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15138] Another function of GAM94 is therefore inhibition of LOC338707 (Accession XP_290534.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338707.

[15139] LOC338739 (Accession XP_294690.1) is another GAM94 target gene, herein designated TARGET GENE. LOC338739 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338739, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338739 BINDING SITE, designated SEQ ID:18110, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15140] Another function of GAM94 is therefore inhibition of LOC338739 (Accession XP_294690.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338739.

[15141] LOC338817 (Accession XP_290588.1) is another GAM94

target gene, herein designated TARGET GENE. LOC338817 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338817, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338817 BINDING SITE, designated SEQ ID:19080, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15142] Another function of GAM94 is therefore inhibition of LOC338817 (Accession XP_290588.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338817.

[15143] LOC338819 (Accession XP_290216.1) is another GAM94 target gene, herein designated TARGET GENE. LOC338819 BINDING SITE1 and LOC338819 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC338819, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338819 BINDING SITE1 and LOC338819 BINDING SITE2, designated SEQ ID:12463

and SEQ ID:6696 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15144] Another function of GAM94 is therefore inhibition of LOC338819 (Accession XP_290216.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338819.

[15145] LOC338963 (Accession XP_294757.1) is another GAM94 target gene, herein designated TARGET GENE. LOC338963 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338963, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338963 BINDING SITE, designated SEQ ID:9380, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15146] Another function of GAM94 is therefore inhibition of LOC338963 (Accession XP_294757.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338963.

[15147] LOC338969 (Accession XP_290223.1) is another GAM94 target gene, herein designated TARGET GENE. LOC338969 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338969, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338969 BINDING SITE, designated SEQ ID:6827, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15148] Another function of GAM94 is therefore inhibition of LOC338969 (Accession XP_290223.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338969.

[15149] LOC338971 (Accession XP_208845.3) is another GAM94 target gene, herein designated TARGET GENE. LOC338971 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338971, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338971 BINDING SITE, designated SEQ ID:8072, to

the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15150] Another function of GAM94 is therefore inhibition of LOC338971 (Accession XP_208845.3) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338971.

[15151] LOC338976 (Accession XP_294762.1) is another GAM94 target gene, herein designated TARGET GENE. LOC338976 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338976, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338976 BINDING SITE, designated SEQ ID:4715, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15152] Another function of GAM94 is therefore inhibition of LOC338976 (Accession XP_294762.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338976.

[15153] LOC338991 (Accession XP_290663.1) is another GAM94

target gene, herein designated TARGET GENE. LOC338991 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338991, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338991 BINDING SITE, designated SEQ ID:8147, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15154] Another function of GAM94 is therefore inhibition of LOC338991 (Accession XP_290663.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338991.

[15155] LOC338999 (Accession XP_290659.1) is another GAM94 target gene, herein designated TARGET GENE. LOC338999 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338999, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338999 BINDING SITE, designated SEQ ID:17003, to the nucleotide sequence of GAM94 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:332.

[15156] Another function of GAM94 is therefore inhibition of LOC338999 (Accession XP_290659.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338999.

[15157] LOC339022 (Accession XP_294775.1) is another GAM94 target gene, herein designated TARGET GENE. LOC339022 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339022, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339022 BINDING SITE, designated SEQ ID:5473, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15158] Another function of GAM94 is therefore inhibition of LOC339022 (Accession XP_294775.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339022.

[15159] LOC339071 (Accession XP_294800.1) is another GAM94 target gene, herein designated TARGET GENE. LOC339071

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339071, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339071 BINDING SITE, designated SEQ ID:6907, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15160] Another function of GAM94 is therefore inhibition of LOC339071 (Accession XP_294800.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339071.

[15161] LOC339149 (Accession XP_294830.1) is another GAM94 target gene, herein designated TARGET GENE. LOC339149 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339149, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339149 BINDING SITE, designated SEQ ID:7097, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15162] Another function of GAM94 is therefore inhibition of LOC339149 (Accession XP_294830.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339149.

[15163] LOC339173 (Accession XP_290741.1) is another GAM94 target gene, herein designated TARGET GENE. LOC339173 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339173, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339173 BINDING SITE, designated SEQ ID:14624, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15164] Another function of GAM94 is therefore inhibition of LOC339173 (Accession XP_290741.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339173.

[15165] LOC339316 (Accession XP_294913.1) is another GAM94 target gene, herein designated TARGET GENE. LOC339316 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC339316, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339316 BINDING SITE, designated SEQ ID:2772, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15166] Another function of GAM94 is therefore inhibition of LOC339316 (Accession XP_294913.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339316.

[15167] LOC339361 (Accession XP_290824.1) is another GAM94 target gene, herein designated TARGET GENE. LOC339361 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339361, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339361 BINDING SITE, designated SEQ ID:17128, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15168] Another function of GAM94 is therefore inhibition of

LOC339361 (Accession XP_290824.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339361.

[15169] LOC339822 (Accession XP_295076.1) is another GAM94 target gene, herein designated TARGET GENE. LOC339822 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339822, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339822 BINDING SITE, designated SEQ ID:6920, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15170] Another function of GAM94 is therefore inhibition of LOC339822 (Accession XP_295076.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339822.

[15171] LOC339827 (Accession XP_295078.1) is another GAM94 target gene, herein designated TARGET GENE. LOC339827 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339827, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339827 BINDING SITE, designated SEQ ID:5741, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15172] Another function of GAM94 is therefore inhibition of LOC339827 (Accession XP_295078.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339827.

[15173] LOC339856 (Accession XP_295087.1) is another GAM94 target gene, herein designated TARGET GENE. LOC339856 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339856, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339856 BINDING SITE, designated SEQ ID:12966, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15174] Another function of GAM94 is therefore inhibition of LOC339856 (Accession XP_295087.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339856.

[15175] LOC340073 (Accession XP_295149.1) is another GAM94 target gene, herein designated TARGET GENE. LOC340073 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340073, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340073 BINDING SITE, designated SEQ ID:2275, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15176] Another function of GAM94 is therefore inhibition of LOC340073 (Accession XP_295149.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340073.

[15177] LOC340090 (Accession XP_295154.1) is another GAM94 target gene, herein designated TARGET GENE. LOC340090 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340090, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340090 BINDING SITE, designated SEQ ID:16277, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15178] Another function of GAM94 is therefore inhibition of LOC340090 (Accession XP_295154.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340090.

[15179] LOC340095 (Accession XP_295160.1) is another GAM94 target gene, herein designated TARGET GENE. LOC340095 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340095, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340095 BINDING SITE, designated SEQ ID:17500, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15180] Another function of GAM94 is therefore inhibition of LOC340095 (Accession XP_295160.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC340095.

[15181] LOC340127 (Accession XP_290379.1) is another GAM94 target gene, herein designated TARGET GENE. LOC340127 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340127, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340127 BINDING SITE, designated SEQ ID:7442, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15182] Another function of GAM94 is therefore inhibition of LOC340127 (Accession XP_290379.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340127.

[15183] LOC340184 (Accession XP_295183.1) is another GAM94 target gene, herein designated TARGET GENE. LOC340184 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340184, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC340184 BINDING SITE, designated SEQ ID:5971, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15184] Another function of GAM94 is therefore inhibition of LOC340184 (Accession XP_295183.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340184.

[15185] LOC340428 (Accession XP_290420.1) is another GAM94 target gene, herein designated TARGET GENE. LOC340428 BINDING SITE1 through LOC340428 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by LOC340428, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340428 BINDING SITE1 through LOC340428 BINDING SITE3, designated SEQ ID:15514, SEQ ID:4350 and SEQ ID:18623 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15186] Another function of GAM94 is therefore inhibition of LOC340428 (Accession XP_290420.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340428.

[15187] LOC340449 (Accession XP_290424.2) is another GAM94 target gene, herein designated TARGET GENE. LOC340449 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340449, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340449 BINDING SITE, designated SEQ ID:2708, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15188] Another function of GAM94 is therefore inhibition of LOC340449 (Accession XP_290424.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340449.

[15189] LOC340895 (Accession XP_295865.1) is another GAM94 target gene, herein designated TARGET GENE. LOC340895 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340895, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340895 BINDING SITE, designated SEQ ID:9851, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15190] Another function of GAM94 is therefore inhibition of LOC340895 (Accession XP_295865.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340895.

[15191] LOC341692 (Accession XP_292171.1) is another GAM94 target gene, herein designated TARGET GENE. LOC341692 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC341692, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC341692 BINDING SITE, designated SEQ ID:998, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15192] Another function of GAM94 is therefore inhibition of LOC341692 (Accession XP_292171.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC341692.

[15193] LOC342125 (Accession XP_292375.1) is another GAM94 target gene, herein designated TARGET GENE. LOC342125 BINDING SITE1 through LOC342125 BINDING SITE4 are target binding sites found in untranslated regions of mRNA encoded by LOC342125, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC342125 BINDING SITE1 through LOC342125 BINDING SITE4, designated SEQ ID:5420, SEQ ID:19109, SEQ ID:16605 and SEQ ID:8505 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15194] Another function of GAM94 is therefore inhibition of LOC342125 (Accession XP_292375.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC342125.

[15195] LOC342490 (Accession XP_296905.2) is another GAM94 target gene, herein designated TARGET GENE. LOC342490 BINDING SITE1 and LOC342490 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by LOC342490, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC342490 BINDING SITE1 and LOC342490 BINDING SITE2, designated SEQ ID:12046 and SEQ ID:14647 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15196] Another function of GAM94 is therefore inhibition of LOC342490 (Accession XP_296905.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC342490.

[15197] LOC342926 (Accession XP_292790.2) is another GAM94 target gene, herein designated TARGET GENE. LOC342926 BINDING SITE1 through LOC342926 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by LOC342926, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC342926 BINDING SITE1 through LOC342926 BINDING SITE3, des-

ignated SEQ ID:10371, SEQ ID:17495 and SEQ ID:5714 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15198] Another function of GAM94 is therefore inhibition of LOC342926 (Accession XP_292790.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC342926.

[15199] LOC343100 (Accession XP_295344.1) is another GAM94 target gene, herein designated TARGET GENE. LOC343100 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC343100, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC343100 BINDING SITE, designated SEQ ID:7081, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15200] Another function of GAM94 is therefore inhibition of LOC343100 (Accession XP_295344.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC343100.

[15201] LOC344600 (Accession XP_293499.2) is another GAM94 target gene, herein designated TARGET GENE. LOC344600 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC344600, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC344600 BINDING SITE, designated SEQ ID:18489, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15202] Another function of GAM94 is therefore inhibition of LOC344600 (Accession XP_293499.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC344600.

[15203] LOC345119 (Accession XP_298539.1) is another GAM94 target gene, herein designated TARGET GENE. LOC345119 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC345119, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC345119 BINDING SITE, designated SEQ ID:9265, to

the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15204] Another function of GAM94 is therefore inhibition of LOC345119 (Accession XP_298539.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC345119.

[15205] LOC346284 (Accession XP_294161.2) is another GAM94 target gene, herein designated TARGET GENE. LOC346284 BINDING SITE1 and LOC346284 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC346284, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC346284 BINDING SITE1 and LOC346284 BINDING SITE2, designated SEQ ID:658 and SEQ ID:10841 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15206] Another function of GAM94 is therefore inhibition of LOC346284 (Accession XP_294161.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC346284.

[15207] LOC346539 (Accession XP_299537.1) is another GAM94 target gene, herein designated TARGET GENE. LOC346539 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC346539, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC346539 BINDING SITE, designated SEQ ID:14088, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15208] Another function of GAM94 is therefore inhibition of LOC346539 (Accession XP_299537.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC346539.

[15209] LOC347774 (Accession XP_290475.1) is another GAM94 target gene, herein designated TARGET GENE. LOC347774 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347774, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC347774 BINDING SITE, designated SEQ ID:734, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15210] Another function of GAM94 is therefore inhibition of LOC347774 (Accession XP_290475.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347774.

[15211] LOC347929 (Accession XP_302565.1) is another GAM94 target gene, herein designated TARGET GENE. LOC347929 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC347929, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347929 BINDING SITE, designated SEQ ID:7034, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15212] Another function of GAM94 is therefore inhibition of LOC347929 (Accession XP_302565.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347929.

[15213] LOC348072 (Accession XP_302652.1) is another GAM94 target gene, herein designated TARGET GENE. LOC348072 BINDING SITE1 and LOC348072 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC348072, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348072 BINDING SITE1 and LOC348072 BINDING SITE2, designated SEQ ID:8955 and SEQ ID:4715 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15214] Another function of GAM94 is therefore inhibition of LOC348072 (Accession XP_302652.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348072.

[15215] LOC348073 (Accession XP_300287.1) is another GAM94 target gene, herein designated TARGET GENE. LOC348073 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348073, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC348073 BINDING SITE, designated SEQ ID:11526, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15216] Another function of GAM94 is therefore inhibition of LOC348073 (Accession XP_300287.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348073.

[15217] LOC348108 (Accession XP_300621.1) is another GAM94 target gene, herein designated TARGET GENE. LOC348108 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348108, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348108 BINDING SITE, designated SEQ ID:1437, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15218] Another function of GAM94 is therefore inhibition of LOC348108 (Accession XP_300621.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC348108.

[15219] LOC348113 (Accession XP_300623.1) is another GAM94 target gene, herein designated TARGET GENE. LOC348113 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348113, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348113 BINDING SITE, designated SEQ ID:8147, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15220] Another function of GAM94 is therefore inhibition of LOC348113 (Accession XP_300623.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348113.

[15221] LOC348142 (Accession XP_300636.1) is another GAM94 target gene, herein designated TARGET GENE. LOC348142 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC348142 BINDING SITE, designated SEQ ID:8147, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15222] Another function of GAM94 is therefore inhibition of LOC348142 (Accession XP_300636.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348142.

[15223] LOC348158 (Accession XP_300646.1) is another GAM94 target gene, herein designated TARGET GENE. LOC348158 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348158, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348158 BINDING SITE, designated SEQ ID:15004, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15224] Another function of GAM94 is therefore inhibition of LOC348158 (Accession XP_300646.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348158.

[15225] LOC348209 (Accession XP_300304.1) is another GAM94 target gene, herein designated TARGET GENE. LOC348209 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348209, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348209 BINDING SITE, designated SEQ ID:4919, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15226] Another function of GAM94 is therefore inhibition of LOC348209 (Accession XP_300304.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348209.

[15227] LOC348404 (Accession XP_302745.1) is another GAM94 target gene, herein designated TARGET GENE. LOC348404 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348404, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348404 BINDING SITE, designated SEQ ID:15845, to

the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15228] Another function of GAM94 is therefore inhibition of LOC348404 (Accession XP_302745.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348404.

[15229] LOC348466 (Accession XP_301189.1) is another GAM94 target gene, herein designated TARGET GENE. LOC348466 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348466, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348466 BINDING SITE, designated SEQ ID:5736, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15230] Another function of GAM94 is therefore inhibition of LOC348466 (Accession XP_301189.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348466.

[15231] LOC348583 (Accession XP_302833.1) is another GAM94

target gene, herein designated TARGET GENE. LOC348583 BINDING SITE1 and LOC348583 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC348583, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348583 BINDING SITE1 and LOC348583 BINDING SITE2, designated SEQ ID:13486 and SEQ ID:9852 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15232] Another function of GAM94 is therefore inhibition of LOC348583 (Accession XP_302833.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348583.

[15233] LOC348790 (Accession XP_300843.1) is another GAM94 target gene, herein designated TARGET GENE. LOC348790 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348790, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC348790 BINDING SITE, designated SEQ ID:12887, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15234] Another function of GAM94 is therefore inhibition of LOC348790 (Accession XP_300843.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348790.

[15235] LOC348808 (Accession XP_302893.1) is another GAM94 target gene, herein designated TARGET GENE. LOC348808 BINDING SITE1 and LOC348808 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC348808, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348808 BINDING SITE1 and LOC348808 BINDING SITE2, designated SEQ ID:19110 and SEQ ID:7768 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15236] Another function of GAM94 is therefore inhibition of LOC348808 (Accession XP_302893.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC348808.

[15237] LOC348835 (Accession XP_302902.1) is another GAM94 target gene, herein designated TARGET GENE. LOC348835 BINDING SITE1 and LOC348835 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC348835, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348835 BINDING SITE1 and LOC348835 BINDING SITE2, designated SEQ ID:4351 and SEQ ID:1352 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15238] Another function of GAM94 is therefore inhibition of LOC348835 (Accession XP_302902.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348835.

[15239] LOC348938 (Accession XP_300883.1) is another GAM94 target gene, herein designated TARGET GENE. LOC348938 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348938, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348938 BINDING SITE, designated SEQ ID:11023, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15240] Another function of GAM94 is therefore inhibition of LOC348938 (Accession XP_300883.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348938.

[15241] LOC349005 (Accession XP_302242.1) is another GAM94 target gene, herein designated TARGET GENE. LOC349005 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349005, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349005 BINDING SITE, designated SEQ ID:14229, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15242] Another function of GAM94 is therefore inhibition of LOC349005 (Accession XP_302242.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349005.

[15243] LOC349361 (Accession XP_303035.1) is another GAM94 target gene, herein designated TARGET GENE. LOC349361 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349361, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349361 BINDING SITE, designated SEQ ID:17756, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15244] Another function of GAM94 is therefore inhibition of LOC349361 (Accession XP_303035.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349361.

[15245] LOC349457 (Accession XP_291364.1) is another GAM94 target gene, herein designated TARGET GENE. LOC349457 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349457, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349457 BINDING SITE, designated SEQ ID:1437, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15246] Another function of GAM94 is therefore inhibition of LOC349457 (Accession XP_291364.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349457.

[15247] LOC349762 (Accession XP_303541.1) is another GAM94 target gene, herein designated TARGET GENE. LOC349762 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349762, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349762 BINDING SITE, designated SEQ ID:12514, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15248] Another function of GAM94 is therefore inhibition of LOC349762 (Accession XP_303541.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC349762.

[15249] LOC350642 (Accession XP_301093.1) is another GAM94 target gene, herein designated TARGET GENE. LOC350642 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC350642, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC350642 BINDING SITE, designated SEQ ID:15794, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15250] Another function of GAM94 is therefore inhibition of LOC350642 (Accession XP_301093.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC350642.

[15251] LOC351096 (Accession XP_304287.1) is another GAM94 target gene, herein designated TARGET GENE. LOC351096 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC351096, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC351096 BINDING SITE, designated SEQ ID:11443, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15252] Another function of GAM94 is therefore inhibition of LOC351096 (Accession XP_304287.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC351096.

[15253] LOC351523 (Accession XP_304883.1) is another GAM94 target gene, herein designated TARGET GENE. LOC351523 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC351523, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC351523 BINDING SITE, designated SEQ ID:13224, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15254] Another function of GAM94 is therefore inhibition of LOC351523 (Accession XP_304883.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC351523.

[15255] LOC351922 (Accession XP_305261.1) is another GAM94 target gene, herein designated TARGET GENE. LOC351922 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC351922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC351922 BINDING SITE, designated SEQ ID:4818, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15256] Another function of GAM94 is therefore inhibition of LOC351922 (Accession XP_305261.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC351922.

[15257] LOC51186 (Accession NP_057387.1) is another GAM94 target gene, herein designated TARGET GENE. LOC51186 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC51186, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC51186 BINDING SITE, designated SEQ ID:11318, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15258] Another function of GAM94 is therefore inhibition of LOC51186 (Accession NP_057387.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51186.

[15259] LOC51320 (Accession NP_057710.1) is another GAM94 target gene, herein designated TARGET GENE. LOC51320 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51320, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51320 BINDING SITE, designated SEQ ID:18717, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15260] Another function of GAM94 is therefore inhibition of LOC51320 (Accession NP_057710.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51320.

[15261] LOC55580 (Accession NP_060041.1) is another GAM94 target gene, herein designated TARGET GENE. LOC55580 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC55580, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC55580 BINDING SITE, designated SEQ ID:16096, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15262] Another function of GAM94 is therefore inhibition of LOC55580 (Accession NP_060041.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC55580.

[15263] LOC55862 (Accession NP_060949.1) is another GAM94 target gene, herein designated TARGET GENE. LOC55862 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC55862, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC55862 BINDING SITE, designated SEQ ID:19025, to the

nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15264] Another function of GAM94 is therefore inhibition of LOC55862 (Accession NP_060949.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC55862.

[15265] LOC90462 (Accession XP_031852.2) is another GAM94 target gene, herein designated TARGET GENE. LOC90462 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90462, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90462 BINDING SITE, designated SEQ ID:9094, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15266] Another function of GAM94 is therefore inhibition of LOC90462 (Accession XP_031852.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90462.

[15267] LOC90673 (Accession XP_033391.5) is another GAM94

target gene, herein designated TARGET GENE. LOC90673 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90673, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90673 BINDING SITE, designated SEQ ID:15191, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15268] Another function of GAM94 is therefore inhibition of LOC90673 (Accession XP_033391.5) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90673.

[15269] LOC90906 (Accession XP_034809.1) is another GAM94 target gene, herein designated TARGET GENE. LOC90906 BINDING SITE1 and LOC90906 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC90906, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE1 and LOC90906 BINDING SITE2, designated SEQ ID:16963

and SEQ ID:16489 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15270] Another function of GAM94 is therefore inhibition of LOC90906 (Accession XP_034809.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906.

[15271] LOC91149 (Accession XP_036480.1) is another GAM94 target gene, herein designated TARGET GENE. LOC91149 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91149, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91149 BINDING SITE, designated SEQ ID:13502, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15272] Another function of GAM94 is therefore inhibition of LOC91149 (Accession XP_036480.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91149.

[15273] LOC91263 (Accession XP_037264.1) is another GAM94 target gene, herein designated TARGET GENE. LOC91263 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91263, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91263 BINDING SITE, designated SEQ ID:19186, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15274] Another function of GAM94 is therefore inhibition of LOC91263 (Accession XP_037264.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91263.

[15275] LOC91565 (Accession XP_039231.1) is another GAM94 target gene, herein designated TARGET GENE. LOC91565 BINDING SITE1 and LOC91565 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC91565, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91565 BINDING SITE1

and LOC91565 BINDING SITE2, designated SEQ ID:5752 and SEQ ID:8304 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15276] Another function of GAM94 is therefore inhibition of LOC91565 (Accession XP_039231.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91565.

[15277] LOC91661 (Accession NP_612381.1) is another GAM94 target gene, herein designated TARGET GENE. LOC91661 BINDING SITE1 and LOC91661 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC91661, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91661 BINDING SITE1 and LOC91661 BINDING SITE2, designated SEQ ID:18909 and SEQ ID:16542 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15278] Another function of GAM94 is therefore inhibition of LOC91661 (Accession NP_612381.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91661.

[15279] LOC91875 (Accession NP_612385.1) is another GAM94 target gene, herein designated TARGET GENE. LOC91875 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91875, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91875 BINDING SITE, designated SEQ ID:15925, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15280] Another function of GAM94 is therefore inhibition of LOC91875 (Accession NP_612385.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91875.

[15281] LOC92017 (Accession XP_042234.2) is another GAM94 target gene, herein designated TARGET GENE. LOC92017 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92017, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92017 BINDING SITE, designated SEQ ID:3847, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15282] Another function of GAM94 is therefore inhibition of LOC92017 (Accession XP_042234.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92017.

[15283] LOC92170 (Accession NP_612393.1) is another GAM94 target gene, herein designated TARGET GENE. LOC92170 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92170, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92170 BINDING SITE, designated SEQ ID:12672, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15284] Another function of GAM94 is therefore inhibition of LOC92170 (Accession NP_612393.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC92170.

[15285] LOC92312 (Accession XP_044166.4) is another GAM94 target gene, herein designated TARGET GENE. LOC92312 BINDING SITE1 through LOC92312 BINDING SITE4 are target binding sites found in untranslated regions of mRNA encoded by LOC92312, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92312 BINDING SITE1 through LOC92312 BINDING SITE4, designated SEQ ID:8613, SEQ ID:13054, SEQ ID:1665 and SEQ ID:10275 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15286] Another function of GAM94 is therefore inhibition of LOC92312 (Accession XP_044166.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92312.

[15287] Leukotriene b4 receptor (LTB4R, Accession NP_000743.1) is another GAM94 target gene, herein designated TARGET GENE. LTB4R BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LTB4R,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LTB4R BINDING SITE, designated SEQ ID:9294, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15288] Another function of GAM94 is therefore inhibition of Leukotriene b4 receptor (LTB4R, Accession NP_000743.1), a gene which may be the cardiac p2y receptor involved in the regulation of cardiac muscle contraction through modulation of l- type calcium currents. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTB4R.

[15289] The function of LTB4R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Macrophage erythroblast attacher (MAEA, Accession NP_005873.1) is another GAM94 target gene, herein designated TARGET GENE. MAEA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAEA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAEA BINDING SITE, designated SEQ ID:4163, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15290] Another function of GAM94 is therefore inhibition of Macrophage erythroblast attacher (MAEA, Accession NP_005873.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAEA.

[15291] Melanoma antigen, family a, 8 (MAGEA8, Accession NP_005355.2) is another GAM94 target gene, herein designated TARGET GENE. MAGEA8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAGEA8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAGEA8 BINDING SITE, designated SEQ ID:7752, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15292] Another function of GAM94 is therefore inhibition of Melanoma antigen, family a, 8 (MAGEA8, Accession

NP_005355.2), a gene which may play a role in embryonal development and tumor transformation or progression. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGEA8.

[15293] The function of MAGEA8 has been established by previous studies. The MAGEA family consists of 12 genes (MAGEA1 to MAGEA12), of which 6, MAGEA1 (OMIM Ref. No. 300016), MAGEA2 (OMIM Ref. No. 300173), MAGEA3 (OMIM Ref. No. 300174), MAGEA4 (OMIM Ref. No. 300175), MAGEA6 (OMIM Ref. No. 300176), and MAGEA12 (OMIM Ref. No. 300177), are expressed in melanomas and other cancers. For further background information on the MAGEA family, see 300016. De Plaen et al. (1994) identified the 12 MAGEA genes. MAGEA8 appeared to be a weakly expressed member of the family. Rogner et al. (1995) isolated a MAGEA8 cDNA from a fetal brain cDNA library. By analysis of cell hybrids, ordered YACs, and cosmids, Rogner et al. (1995) localized the MAGEA cluster to Xq28. They showed that the 12 genes are arranged in 3 clusters within 3.5 Mb. De Plaen et al. (1999) mapped the mouse Mage8 gene to the X chromosome.

[15294]

[15295] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15296] De Plaen, E.; De Backer, O.; Arnaud, D.; Bonjean, B.; Chomez, P.; Martelange, V.; Avner, P.; Baldacci, P.; Babinet, C.; Hwang, S.- Y.; Knowles, B.; Boon, T. : A new family of mouse genes homologous to the human MAGE genes. Genomics 55: 176- 184, 1999. ; and

[15297] Rogner, U. C.; Wilke, K.; Steck, E.; Korn, B.; Poustka, A. : The melanoma antigen gene (MAGE) family is clustered in the chromosomal band Xq28. Genomics 29: 725- 731, 1995.

[15298] Further studies establishing the function and utilities of MAGEA8 are found in John Hopkins OMIM database record ID 300341, and in cited publications listed in Table 5, which are hereby incorporated by reference.Microtubule-associated protein 1b (MAP1B, Accession NP_114399.1) is another GAM94 target gene, herein designated TARGET GENE. MAP1B BINDING SITE1 and MAP1B BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by MAP1B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP1B BINDING SITE1 and MAP1B BINDING SITE2, designated SEQ ID:1647 and SEQ ID:6508 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15299] Another function of GAM94 is therefore inhibition of Microtubule-associated protein 1b (MAP1B, Accession NP_114399.1), a gene which may have a role in neuronal plasticity and brain development. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1B.

[15300] The function of MAP1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM38.1.Microtubule-associated protein 1b (MAP1B, Accession NP_005900.1) is another GAM94 target gene, herein designated TARGET GENE. MAP1B BINDING SITE1 and MAP1B BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by MAP1B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP1B BINDING SITE1 and MAP1B

BINDING SITE2, designated SEQ ID:1647 and SEQ ID:6508 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15301] Another function of GAM94 is therefore inhibition of Microtubule-associated protein 1b (MAP1B, Accession NP_005900.1), a gene which may have a role in neuronal plasticity and brain development. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1B.

[15302] The function of MAP1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM38.1.Mitogen-activated protein kinase kinase kinase 2 (MAP3K2, Accession NP_006600.2) is another GAM94 target gene, herein designated TARGET GENE. MAP3K2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAP3K2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP3K2 BINDING SITE, designated SEQ ID:2581, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15303] Another function of GAM94 is therefore inhibition of Mitogen-activated protein kinase kinase kinase 2 (MAP3K2, Accession NP_006600.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K2.

[15304] Mads box transcription enhancer factor 2, polypeptide c (myocyte enhancer factor 2c) (MEF2C, Accession NP_002388.2) is another GAM94 target gene, herein designated TARGET GENE. MEF2C BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MEF2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEF2C BINDING SITE, designated SEQ ID:16421, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15305] Another function of GAM94 is therefore inhibition of Mads box transcription enhancer factor 2, polypeptide c (myocyte enhancer factor 2c) (MEF2C, Accession NP_002388.2), a gene which regulates muscle- specific and mitogen- inducible genes. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2C.

[15306] The function of MEF2C has been established by previous studies. The MEF2 family of regulatory proteins are, like the myogenic basic helix- loop- helix proteins (e.g., 159970), involved in myogenesis; see MEF2A (OMIM Ref. No. 600660). McDermott et al. (1993) cloned a member of the MEF2 family of proteins from a human skeletal muscle cDNA library using a fragment of the MEF2A cDNA as a probe. Transcripts of MEF2C were found in the skeletal muscle and brain. Alternative splice variants were found, 1 of which was unique to the brain. Leifer et al. (1993) found that the brain form was expressed by neurons in particular layers of the cerebral cortex and that expression declined during postnatal development. The skeletal isoform of the cDNA encodes a 465- amino acid protein with conserved MADS and MEF2 domains. Like the other MEF2 gene products, MEF2C has both DNA binding and trans- activating activities indistinguishable from other members of the family. MEF2C, however, is induced late during myogenic differentiation and has a strict tissue-specific pattern of expression not seen in MEF2A or MEF2B. Breitbart et al. (1993) suggested that, while MEF2A may be involved in induction of muscle differentiation, MEF2C may be involved with maintenance of the differen-

tiated state. CREB- binding protein (CBP; 600140)/p300 (OMIM Ref. No. 602700) and p300/CBP- associated factor (PCAF; 602203) are coactivators for MEF2C during differentiation. Chen et al. (2000) showed that NCOA2 mediates the coactivation of MEF2C- dependent transcription through interaction with the MADS box domain of MEF2C. They proposed a model of cooperative interaction between NCOA2, myogenin (MYOG; 159980), and MEF2C in the regulation of muscle- specific gene expression. During mammalian development, electrical activity promotes the calcium- dependent survival of neurons that have made appropriate synaptic connections. Mao et al. (1999) showed that calcium influx into cerebellar neurons triggers the activation of the MKK6 (OMIM Ref. No. 601254)-p38 MAP kinase (OMIM Ref. No. 600289) cascade and that the p38 MAP kinase then phosphorylates and activates MEF2s. Once activated by this calcium- dependent p38 MAP kinase signaling pathway, MEF2 can regulate the expression of genes that are critical for survival of newly differentiated neurons. These findings demonstrated that MEF2 is a calcium- regulated transcription factor and defined a function for MEF2 during nervous system development that is distinct from previously well- characterized

functions of MEF2 during muscle differentiation. Martin et al. (1994) mapped Mef2 to mouse chromosome 13. By fluorescence in situ hybridization, Krainc et al. (1995) mapped human MEF2C to 5q14, a region with homology of synteny to the mouse location. Members of the MEF2 family of MADs- box transcription factors bind to an A-T- rich DNA sequence associated with muscle- specific genes. The murine MEF2C gene is expressed in heart precursor cells before formation of the linear heart tube. In mice homozygous for a known mutation of MEF2C, Lin et al. (1997) found that the heart tube did not undergo looping morphogenesis, the future right ventricle did not form, and a subset of cardiac muscle genes was not expressed. The absence of the right ventricular region of the mutant correlated with downregulation of the dHAND gene, which encodes a basic helix- loop- helix transcription factor required for cardiac morphogenesis. The authors concluded that MEF2C is an essential regulator of cardiac morphogenesis and right ventricular development.

[15307]

[15308] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15309] Breitbart, R. E.; Liang, C.; Smoot, L. B.; Laheru, D. A.; Mahdavi, V.; Nadal- Ginard, B. : A fourth human MEF2 transcription factor, hMEF2D, is an early marker of the myogenic lineage. Development 118: 1095- 1106, 1993. ; and

[15310] Chen, S. L.; Dowhan, D. H.; Hosking, B. M.; Muscat, G. E. O. : The steroid receptor coactivator, GRIP- 1, is necessary for MEF- 2C- dependent gene expression and skeletal muscle differenti.

[15311] Further studies establishing the function and utilities of MEF2C are found in John Hopkins OMIM database record ID 600662, and in cited publications listed in Table 5, which are hereby incorporated by reference.MEGF10 (Accession NP_115822.1) is another GAM94 target gene, herein designated TARGET GENE. MEGF10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MEGF10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEGF10 BINDING SITE, designated SEQ ID:15932, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15312] Another function of GAM94 is therefore inhibition of

MEGF10 (Accession NP_115822.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEGF10.

[15313] Meis1, myeloid ecotropic viral integration site 1 homolog 2 (mouse) (MEIS2, Accession NP_733775.1) is another GAM94 target gene, herein designated TARGET GENE. MEIS2 BINDING SITE1 and MEIS2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by MEIS2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEIS2 BINDING SITE1 and MEIS2 BINDING SITE2, designated SEQ ID:19135 and SEQ ID:19135 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15314] Another function of GAM94 is therefore inhibition of Meis1, myeloid ecotropic viral integration site 1 homolog 2 (mouse) (MEIS2, Accession NP_733775.1), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS2.

[15315] The function of MEIS2 has been established by previous studies. The Meis1 locus (OMIM Ref. No. 601739) was isolated as a common site of viral integration involved in myeloid leukemia in BXH- 2 mice. Steelman et al. (1997) noted that MEIS1 encodes a homeo box protein belonging to the TALE ('three amino acid loop extension') family of homeodomain- containing proteins. The homeodomain of MEIS1 is the only conserved motif in the entire 390- amino acid protein. Steelman et al. (1997) reported that Southern blot analyses using the MEIS1 homeodomain as a probe revealed the existence of a family of Meis1- related genes (MRGs) in several divergent species. In addition, the 3- prime untranslated region (UTR) of MEIS1 is remarkably conserved in evolution. Steelman et al. (1997) cloned Meis1- related genes from the mouse and human genomes. One such gene, which the authors designated Mrg1, shares a similar genomic organization in the mouse with Meis1 but was found to be located on mouse chromosome 2, not mouse chromosome 11, where Meis1 maps. In humans, Steelman et al. (1997) mapped MRG1 to 15q22- q25 in a region associated with various cytogenetic abnormalities associated with acute myelocytic leukemia, chronic myeloid leukemia, and astrocytomas.

The authors reported data suggesting that another related gene (MRG2) maps to human chromosome 17. During the course of their studies of the human MEIS1 homeo box gene, Smith et al. (1997) identified a gene closely related but not identical to MEIS1. Sequence analysis showed it to be the human counterpart of the mouse gene Meis2 (Nakamura et al., 1996). Human MEIS2 was found to be expressed in various human tissues. In hematopoietic tissues, the lymphoid organs expressed high levels of MEIS2 as 2 transcripts of 4.0 kb and 3.5 kb. MEIS2 is also expressed in some regions of the brain, such as the putamen. Nakamura et al. (1996) mapped the mouse Meis2 gene to chromosome 2 in a region syntenic to human 15q. By fluorescence in situ hybridization with a genomic MEIS2 clone, Smith et al. (1997) mapped the human MEIS2 gene to a position that is 27% of the distance from the chromosome 15 centromere to the telomere, corresponding to 15q14. Capdevila et al. (1999) showed that restriction of expression of the chick homeobox gene Meis2 to proximal regions of the limb bud is essential for limb development, since ectopic Meis2 severely disrupted limb outgrowth. They also uncovered an antagonistic relationship between the secreted factor Gremlin (OMIM Ref. No.

603054) and the bone morphogenetic proteins (Bmps; OMIM Ref. No. 112264) that is required to maintain the Sonic hedgehog (OMIM Ref. No. 600725)/fibroblast growth factor (see OMIM Ref. No. 131220) loop that regulates distal outgrowth. These proximal and distal factors were found to have coordinated activities: Meis2 could repress distal genes, and the Bmp and Hoxd (OMIM Ref. No. 142987) genes restricted Meis2 expression to the proximal limb bud. Moreover, combinations of Bmps and apical ectodermal ridge (AER) factors were sufficient to distalize proximal limb cells. These results unveiled a set of proximal- distal regulatory interactions that establish and maintain outgrowth of the vertebrate limb. Mercader et al. (1999) described the role of homeo box genes Meis1, Meis2, and Pbx1 (OMIM Ref. No. 176310) in the development of mouse, chicken, and Drosophila limbs. Mercader et al. (1999) found that Meis1 and Meis2 expression is restricted to the proximal domain, coincident with the previously reported domain in which Pbx1 is localized to the nucleus. Meis1 regulates Pbx1 activity by promoting nuclear import of the Pbx1 protein. Mercader et al. (1999) also demonstrated that ectopic expression of Meis1 in chicken disrupts distal limb development and induces dis-

tal- to- proximal transformations. Mercader et al. (1999) concluded that the restriction of Meis1 to proximal regions of the vertebrate limb is essential to specify cell fates and differentiation patterns along the proximodistal axis of the limb.

[15316]

[15317] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15318] Capdevila, J.; Tsukui, T.; Esteban, C. R.; Zappavigna, V.; Belmonte, J. C. I. : Control of vertebrate limb outgrowth by the proximal factor Meis2 and distal antagonism of BMPs by Gremlin. Molec. Cell 4: 839- 849, 1999. ; and

[15319] Mercader, N.; Leonardo, E.; Azpiazu, N.; Serrano, A.; Morata, G.; Martinez- A, C.; Torres, M. : Conserved regulation of proximodistal limb axis development by Meis1/Hth. Nature 402: 425.

[15320] Further studies establishing the function and utilities of MEIS2 are found in John Hopkins OMIM database record ID 601740, and in cited publications listed in Table 5, which are hereby incorporated by reference.Meis1, myeloid ecotropic viral integration site 1 homolog 2 (mouse) (MEIS2, Accession NP_064534.1) is another GAM94 target

gene, herein designated TARGET GENE. MEIS2 BINDING SITE1 and MEIS2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by MEIS2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEIS2 BINDING SITE1 and MEIS2 BINDING SITE2, designated SEQ ID:19135 and SEQ ID:19135 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15321] Another function of GAM94 is therefore inhibition of Meis1, myeloid ecotropic viral integration site 1 homolog 2 (mouse) (MEIS2, Accession NP_064534.1), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS2.

[15322] The function of MEIS2 has been established by previous studies. The Meis1 locus (OMIM Ref. No. 601739) was isolated as a common site of viral integration involved in myeloid leukemia in BXH- 2 mice. Steelman et al. (1997) noted that MEIS1 encodes a homeo box protein belonging

to the TALE ('three amino acid loop extension') family of homeodomain- containing proteins. The homeodomain of MEIS1 is the only conserved motif in the entire 390- amino acid protein. Steelman et al. (1997) reported that Southern blot analyses using the MEIS1 homeodomain as a probe revealed the existence of a family of Meis1- related genes (MRGs) in several divergent species. In addition, the 3- prime untranslated region (UTR) of MEIS1 is remarkably conserved in evolution. Steelman et al. (1997) cloned Meis1- related genes from the mouse and human genomes. One such gene, which the authors designated Mrg1, shares a similar genomic organization in the mouse with Meis1 but was found to be located on mouse chromosome 2, not mouse chromosome 11, where Meis1 maps. In humans, Steelman et al. (1997) mapped MRG1 to 15q22- q25 in a region associated with various cytogenetic abnormalities associated with acute myelocytic leukemia, chronic myeloid leukemia, and astrocytomas. The authors reported data suggesting that another related gene (MRG2) maps to human chromosome 17. During the course of their studies of the human MEIS1 homeo box gene, Smith et al. (1997) identified a gene closely related but not identical to MEIS1. Sequence analysis showed it to

be the human counterpart of the mouse gene Meis2 (Nakamura et al., 1996). Human MEIS2 was found to be expressed in various human tissues. In hematopoietic tissues, the lymphoid organs expressed high levels of MEIS2 as 2 transcripts of 4.0 kb and 3.5 kb. MEIS2 is also expressed in some regions of the brain, such as the putamen. Nakamura et al. (1996) mapped the mouse Meis2 gene to chromosome 2 in a region syntenic to human 15q. By fluorescence in situ hybridization with a genomic MEIS2 clone, Smith et al. (1997) mapped the human MEIS2 gene to a position that is 27% of the distance from the chromosome 15 centromere to the telomere, corresponding to 15q14. Capdevila et al. (1999) showed that restriction of expression of the chick homeobox gene Meis2 to proximal regions of the limb bud is essential for limb development, since ectopic Meis2 severely disrupted limb outgrowth. They also uncovered an antagonistic relationship between the secreted factor Gremlin (OMIM Ref. No. 603054) and the bone morphogenetic proteins (Bmps; OMIM Ref. No. 112264) that is required to maintain the Sonic hedgehog (OMIM Ref. No. 600725)/fibroblast growth factor (see OMIM Ref. No. 131220) loop that regulates distal outgrowth. These proximal and distal factors

were found to have coordinated activities: Meis2 could repress distal genes, and the Bmp and Hoxd (OMIM Ref. No. 142987) genes restricted Meis2 expression to the proximal limb bud. Moreover, combinations of Bmps and apical ectodermal ridge (AER) factors were sufficient to distalize proximal limb cells. These results unveiled a set of proximal- distal regulatory interactions that establish and maintain outgrowth of the vertebrate limb. Mercader et al. (1999) described the role of homeo box genes Meis1, Meis2, and Pbx1 (OMIM Ref. No. 176310) in the development of mouse, chicken, and Drosophila limbs. Mercader et al. (1999) found that Meis1 and Meis2 expression is restricted to the proximal domain, coincident with the previously reported domain in which Pbx1 is localized to the nucleus. Meis1 regulates Pbx1 activity by promoting nuclear import of the Pbx1 protein. Mercader et al. (1999) also demonstrated that ectopic expression of Meis1 in chicken disrupts distal limb development and induces distal- to- proximal transformations. Mercader et al. (1999) concluded that the restriction of Meis1 to proximal regions of the vertebrate limb is essential to specify cell fates and differentiation patterns along the proximodistal axis of the limb.

[15327] Further studies establishing the function and utilities of MEIS2 are found in John Hopkins OMIM database record ID 601740, and in cited publications listed in Table 5, which are hereby incorporated by reference.Meis1, myeloid ecotropic viral integration site 1 homolog 2 (mouse) (MEIS2, Accession NP_002390.1) is another GAM94 target gene, herein designated TARGET GENE. MEIS2 BINDING SITE1 and MEIS2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by MEIS2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEIS2 BINDING SITE1 and MEIS2 BINDING SITE2, designated SEQ ID:2527 and SEQ ID:19135 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15328] Another function of GAM94 is therefore inhibition of Meis1, myeloid ecotropic viral integration site 1 homolog 2 (mouse) (MEIS2, Accession NP_002390.1), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS2.

[15329] The function of MEIS2 has been established by previous studies. The Meis1 locus (OMIM Ref. No. 601739) was isolated as a common site of viral integration involved in myeloid leukemia in BXH- 2 mice. Steelman et al. (1997) noted that MEIS1 encodes a homeo box protein belonging to the TALE ('three amino acid loop extension') family of homeodomain- containing proteins. The homeodomain of MEIS1 is the only conserved motif in the entire 390-amino acid protein. Steelman et al. (1997) reported that Southern blot analyses using the MEIS1 homeodomain as

a probe revealed the existence of a family of Meis1- related genes (MRGs) in several divergent species. In addition, the 3- prime untranslated region (UTR) of MEIS1 is remarkably conserved in evolution. Steelman et al. (1997) cloned Meis1- related genes from the mouse and human genomes. One such gene, which the authors designated Mrg1, shares a similar genomic organization in the mouse with Meis1 but was found to be located on mouse chromosome 2, not mouse chromosome 11, where Meis1 maps. In humans, Steelman et al. (1997) mapped MRG1 to 15q22- q25 in a region associated with various cytogenetic abnormalities associated with acute myelocytic leukemia, chronic myeloid leukemia, and astrocytomas. The authors reported data suggesting that another related gene (MRG2) maps to human chromosome 17. During the course of their studies of the human MEIS1 homeo box gene, Smith et al. (1997) identified a gene closely related but not identical to MEIS1. Sequence analysis showed it to be the human counterpart of the mouse gene Meis2 (Nakamura et al., 1996). Human MEIS2 was found to be expressed in various human tissues. In hematopoietic tissues, the lymphoid organs expressed high levels of MEIS2 as 2 transcripts of 4.0 kb and 3.5 kb. MEIS2 is also ex-

pressed in some regions of the brain, such as the putamen. Nakamura et al. (1996) mapped the mouse Meis2 gene to chromosome 2 in a region syntenic to human 15q. By fluorescence in situ hybridization with a genomic MEIS2 clone, Smith et al. (1997) mapped the human MEIS2 gene to a position that is 27% of the distance from the chromosome 15 centromere to the telomere, corresponding to 15q14. Capdevila et al. (1999) showed that restriction of expression of the chick homeobox gene Meis2 to proximal regions of the limb bud is essential for limb development, since ectopic Meis2 severely disrupted limb outgrowth. They also uncovered an antagonistic relationship between the secreted factor Gremlin (OMIM Ref. No. 603054) and the bone morphogenetic proteins (Bmps; OMIM Ref. No. 112264) that is required to maintain the Sonic hedgehog (OMIM Ref. No. 600725)/fibroblast growth factor (see OMIM Ref. No. 131220) loop that regulates distal outgrowth. These proximal and distal factors were found to have coordinated activities: Meis2 could repress distal genes, and the Bmp and Hoxd (OMIM Ref. No. 142987) genes restricted Meis2 expression to the proximal limb bud. Moreover, combinations of Bmps and apical ectodermal ridge (AER) factors were sufficient to distalize

proximal limb cells. These results unveiled a set of proximal- distal regulatory interactions that establish and maintain outgrowth of the vertebrate limb. Mercader et al. (1999) described the role of homeo box genes Meis1, Meis2, and Pbx1 (OMIM Ref. No. 176310) in the development of mouse, chicken, and Drosophila limbs. Mercader et al. (1999) found that Meis1 and Meis2 expression is restricted to the proximal domain, coincident with the previously reported domain in which Pbx1 is localized to the nucleus. Meis1 regulates Pbx1 activity by promoting nuclear import of the Pbx1 protein. Mercader et al. (1999) also demonstrated that ectopic expression of Meis1 in chicken disrupts distal limb development and induces distal- to- proximal transformations. Mercader et al. (1999) concluded that the restriction of Meis1 to proximal regions of the vertebrate limb is essential to specify cell fates and differentiation patterns along the proximodistal axis of the limb.

[15330]

[15331] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Belmonte, J. C. I. : Control of vertebrate limb outgrowth by the proximal factor Meis2 and distal antagonism of BMPs by Gremlin. Molec. Cell 4: 839- 849, 1999. ; and

[15333] Mercader, N.; Leonardo, E.; Azpiazu, N.; Serrano, A.; Morata, G.; Martinez- A, C.; Torres, M. : Conserved regulation of proximodistal limb axis development by Meis1/Hth. Nature 402: 425.

[15334] Further studies establishing the function and utilities of MEIS2 are found in John Hopkins OMIM database record ID 601740, and in cited publications listed in Table 5, which are hereby incorporated by reference.MGC12921 (Accession NP_116117.1) is another GAM94 target gene, herein designated TARGET GENE. MGC12921 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC12921, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC12921 BINDING SITE, designated SEQ ID:13510, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15335] Another function of GAM94 is therefore inhibition of MGC12921 (Accession NP_116117.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12921.

[15336] MGC14136 (Accession NP_116299.1) is another GAM94 target gene, herein designated TARGET GENE. MGC14136 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC14136, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC14136 BINDING SITE, designated SEQ ID:1773, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15337] Another function of GAM94 is therefore inhibition of MGC14136 (Accession NP_116299.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14136.

[15338] MGC15476 (Accession NP_659493.1) is another GAM94 target gene, herein designated TARGET GENE. MGC15476 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC15476, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15476 BINDING SITE, designated SEQ ID:524, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15339] Another function of GAM94 is therefore inhibition of MGC15476 (Accession NP_659493.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15476.

[15340] MGC15631 (Accession NP_116142.1) is another GAM94 target gene, herein designated TARGET GENE. MGC15631 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC15631, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15631 BINDING SITE, designated SEQ ID:17793, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15341] Another function of GAM94 is therefore inhibition of MGC15631 (Accession NP_116142.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC15631.

[15342] MGC16044 (Accession NP_612380.1) is another GAM94 target gene, herein designated TARGET GENE. MGC16044 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC16044, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC16044 BINDING SITE, designated SEQ ID:10140, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15343] Another function of GAM94 is therefore inhibition of MGC16044 (Accession NP_612380.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16044.

[15344] MGC16063 (Accession NP_444275.1) is another GAM94 target gene, herein designated TARGET GENE. MGC16063 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC16063, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC16063 BINDING SITE, designated SEQ ID:17265, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15345] Another function of GAM94 is therefore inhibition of MGC16063 (Accession NP_444275.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16063.

[15346] MGC23980 (Accession NP_659442.2) is another GAM94 target gene, herein designated TARGET GENE. MGC23980 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC23980, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC23980 BINDING SITE, designated SEQ ID:4692, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15347] Another function of GAM94 is therefore inhibition of MGC23980 (Accession NP_659442.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC23980.

[15348] MGC24995 (Accession NP_714914.1) is another GAM94 target gene, herein designated TARGET GENE. MGC24995 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC24995, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC24995 BINDING SITE, designated SEQ ID:18721, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15349] Another function of GAM94 is therefore inhibition of MGC24995 (Accession NP_714914.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC24995.

[15350] MGC2705 (Accession NP_116090.2) is another GAM94 target gene, herein designated TARGET GENE. MGC2705 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC2705, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MGC2705 BINDING SITE, designated SEQ ID:4995, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15351] Another function of GAM94 is therefore inhibition of MGC2705 (Accession NP_116090.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2705.

[15352] MGC27382 (Accession XP_294972.1) is another GAM94 target gene, herein designated TARGET GENE. MGC27382 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC27382, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC27382 BINDING SITE, designated SEQ ID:10511, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15353] Another function of GAM94 is therefore inhibition of MGC27382 (Accession XP_294972.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC27382.

[15354] MGC32104 (Accession NP_653285.1) is another GAM94

target gene, herein designated TARGET GENE. MGC32104 BINDING SITE1 and MGC32104 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by MGC32104, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC32104 BINDING SITE1 and MGC32104 BINDING SITE2, designated SEQ ID:6076 and SEQ ID:3355 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15355] Another function of GAM94 is therefore inhibition of MGC32104 (Accession NP_653285.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32104.

[15356] MGC3262 (Accession NP_076934.1) is another GAM94 target gene, herein designated TARGET GENE. MGC3262 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3262, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MGC3262 BINDING SITE, designated SEQ ID:8239, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15357] Another function of GAM94 is therefore inhibition of MGC3262 (Accession NP_076934.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3262.

[15358] MGC33974 (Accession NP_699181.1) is another GAM94 target gene, herein designated TARGET GENE. MGC33974 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC33974, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC33974 BINDING SITE, designated SEQ ID:16821, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15359] Another function of GAM94 is therefore inhibition of MGC33974 (Accession NP_699181.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33974.

[15360] MGC39518 (Accession NP_776183.1) is another GAM94

target gene, herein designated TARGET GENE. MGC39518 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC39518, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC39518 BINDING SITE, designated SEQ ID:4349, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15361] Another function of GAM94 is therefore inhibition of MGC39518 (Accession NP_776183.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC39518.

[15362] MGC40107 (Accession NP_689979.1) is another GAM94 target gene, herein designated TARGET GENE. MGC40107 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC40107, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC40107 BINDING SITE, designated SEQ ID:20005, to the nucleotide sequence of GAM94 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:332.

[15363] Another function of GAM94 is therefore inhibition of MGC40107 (Accession NP_689979.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC40107.

[15364] MGC40168 (Accession NP_714920.1) is another GAM94 target gene, herein designated TARGET GENE. MGC40168 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC40168, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC40168 BINDING SITE, designated SEQ ID:10970, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15365] Another function of GAM94 is therefore inhibition of MGC40168 (Accession NP_714920.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC40168.

[15366] MGC4607 (Accession NP_113631.1) is another GAM94 target gene, herein designated TARGET GENE. MGC4607

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC4607, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4607 BINDING SITE, designated SEQ ID:10730, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15367] Another function of GAM94 is therefore inhibition of MGC4607 (Accession NP_113631.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4607.

[15368] Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NP_002421.2) is another GAM94 target gene, herein designated TARGET GENE. MN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MN1 BINDING SITE, designated SEQ ID:15003, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15369] Another function of GAM94 is therefore inhibition of Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NP_002421.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MN1.

[15370] MOST2 (Accession NP_064635.1) is another GAM94 target gene, herein designated TARGET GENE. MOST2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MOST2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MOST2 BINDING SITE, designated SEQ ID:677, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15371] Another function of GAM94 is therefore inhibition of MOST2 (Accession NP_064635.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOST2.

[15372] MOT8 (Accession NP_061324.1) is another GAM94 target gene, herein designated TARGET GENE. MOT8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MOT8, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MOT8 BINDING SITE, designated SEQ ID:16345, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15373] Another function of GAM94 is therefore inhibition of MOT8 (Accession NP_061324.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOT8.

[15374] Mll septin-like fusion (MSF, Accession NP_006631.1) is another GAM94 target gene, herein designated TARGET GENE. MSF BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MSF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MSF BINDING SITE, designated SEQ ID:18395, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15375] Another function of GAM94 is therefore inhibition of Mll septin-like fusion (MSF, Accession NP_006631.1), a gene which plays a role in the cell cycle. and therefore may be

associated with Therapy- related acute myeloid leukemia, ovarian tumors. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Therapy- related acute myeloid leukemia, ovarian tumors, and of other diseases and clinical conditions associated with MSF.

[15376] The function of MSF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM71.1.Myotubularin related protein 9 (MTMR9, Accession NP_056273.2) is another GAM94 target gene, herein designated TARGET GENE. MTMR9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MTMR9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MTMR9 BINDING SITE, designated SEQ ID:15033, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15377] Another function of GAM94 is therefore inhibition of Myotubularin related protein 9 (MTMR9, Accession NP_056273.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with MTMR9.

[15378] Mucin 17 (MUC17, Accession XP_168583.2) is another GAM94 target gene, herein designated TARGET GENE. MUC17 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MUC17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MUC17 BINDING SITE, designated SEQ ID:678, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15379] Another function of GAM94 is therefore inhibition of Mucin 17 (MUC17, Accession XP_168583.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC17.

[15380] Max interacting protein 1 (MXI1, Accession NP_569157.1) is another GAM94 target gene, herein designated TARGET GENE. MXI1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MXI1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of MXI1 BINDING SITE, designated SEQ ID:1149, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15381] Another function of GAM94 is therefore inhibition of Max interacting protein 1 (MXI1, Accession NP_569157.1), a gene which acts as a tumor suppressor in vivo, engages the MYC network in a functionally relevant manner and therefore may be associated with Prostate cancer, neurofibrosarcoma. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Prostate cancer, neurofibrosarcoma, and of other diseases and clinical conditions associated with MXI1.

[15382] The function of MXI1 has been established by previous studies. One of the most common chromosomal abnormalities in prostate cancer involves loss of 10q22- qter. Rarely, a smaller deletion, involving 10q24- q25 has been observed, suggesting the presence of a tumor suppressor gene at that site. Prochownik et al. (1998) prospectively evaluated prostate tumors for loss of MXI1 by FISH and cytogenetic techniques. Of 40 tumors, 21 (53%) demonstrated loss of a single MXI1 allele, as determined by FISH. In 10 cases with cytogenetically normal long arms of

chromosome 10, but with FISH- documented deletion of MXI1, 8 mutations of MXI1 were identified. Five of the mutant proteins were incapable of binding DNA in association with MAX. Prochownik et al. (1998) concluded that MXI1 gene loss in prostate cancer is common and most frequently involves a cytogenetically undetectable deletion.

[15383] Animal model experiments lend further support to the function of MXI1. MXI1 belongs to the family of proteins that function as potent antagonists of MYC oncoproteins. This antagonism relates to their ability to compete with MYC for the protein MAX and for consensus DNA binding sites and to recruit Sin3 proteins and their associated corepressors. Schreiber- Agus et al. (1998) disrupted the Mxi1 open reading frame in transgenic mice by eliminating an exon required for the production of the 2 mouse Mxi1 isoforms. They showed that the mice lacking Mxi1 exhibit progressive multisystem abnormalities. The mice also showed increased susceptibility to tumorigenesis either following carcinogen treatment or when also deficient in INK4A (OMIM Ref. No. 600160). This cancer- prone phenotype may correspond with the enhanced ability of several MXI1- deficient cell types, including prostatic ep-

ithelium, to proliferate. The results show that MXI1 is involved in the homeostasis of differentiated organ systems, acts as a tumor suppressor in vivo, and engages the MYC network in a functionally relevant manner. In histologic studies of the mice, Schreiber- Agus et al. (1998) focused particularly on organs that normally express high or sustained levels of Mxi1, e.g., brain, spleen, kidney, and liver, and on tissue types that are susceptible to tumorigenesis when a putative tumor suppressor is lost from the 10q24-q26 region; for example, the spleen and thymus are susceptible to T- cell leukemia, the prostatic epithelium to prostate cancer, and the brain to glioblastoma multiforme when the 10q24- q26 region is mutated.

[15384] It is appreciated that the abovementioned animal model for MXI1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[15385] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15386] Prochownik, E. V.; Grove, L. E.; Deubler, D.; Zhu, X. L.; Stephenson, R. A.; Rohr, L. R.; Yin, X.; Brothman, A. R. : Commonly occurring loss and mutation of the MXI1 gene

in prostate cancer. Genes Chromosomes Cancer 22: 295-304, 1998. ; and

[15387] Schreiber- Agus, N.; Meng, Y.; Hoang, T.; Hou, H., Jr.; Chen, K.; Greenberg, R.; Cordon- Cardo, C.; Lee, H.- W.; DePinho, R. A. : Role of Mxi1 in ageing organ systems and the regulation of.

[15388] Further studies establishing the function and utilities of MXI1 are found in John Hopkins OMIM database record ID 600020, and in cited publications listed in Table 5, which are hereby incorporated by reference.Max interacting protein 1 (MXI1, Accession NP_005953.2) is another GAM94 target gene, herein designated TARGET GENE. MXI1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MXI1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MXI1 BINDING SITE, designated SEQ ID:1149, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15389] Another function of GAM94 is therefore inhibition of Max interacting protein 1 (MXI1, Accession NP_005953.2), a gene which acts as a tumor suppressor in vivo, engages

the MYC network in a functionally relevant manner and therefore may be associated with Prostate cancer, neurofibrosarcoma. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Prostate cancer, neurofibrosarcoma, and of other diseases and clinical conditions associated with MXI1.

[15390] The function of MXI1 has been established by previous studies. One of the most common chromosomal abnormalities in prostate cancer involves loss of 10q22- qter. Rarely, a smaller deletion, involving 10q24- q25 has been observed, suggesting the presence of a tumor suppressor gene at that site. Prochownik et al. (1998) prospectively evaluated prostate tumors for loss of MXI1 by FISH and cytogenetic techniques. Of 40 tumors, 21 (53%) demonstrated loss of a single MXI1 allele, as determined by FISH. In 10 cases with cytogenetically normal long arms of chromosome 10, but with FISH- documented deletion of MXI1, 8 mutations of MXI1 were identified. Five of the mutant proteins were incapable of binding DNA in association with MAX. Prochownik et al. (1998) concluded that MXI1 gene loss in prostate cancer is common and most frequently involves a cytogenetically undetectable deletion.

[15391] Animal model experiments lend further support to the function of MXI1. MXI1 belongs to the family of proteins that function as potent antagonists of MYC oncoproteins. This antagonism relates to their ability to compete with MYC for the protein MAX and for consensus DNA binding sites and to recruit Sin3 proteins and their associated corepressors. Schreiber- Agus et al. (1998) disrupted the Mxi1 open reading frame in transgenic mice by eliminating an exon required for the production of the 2 mouse Mxi1 isoforms. They showed that the mice lacking Mxi1 exhibit progressive multisystem abnormalities. The mice also showed increased susceptibility to tumorigenesis either following carcinogen treatment or when also deficient in INK4A (OMIM Ref. No. 600160). This cancer- prone phenotype may correspond with the enhanced ability of several MXI1- deficient cell types, including prostatic epithelium, to proliferate. The results show that MXI1 is involved in the homeostasis of differentiated organ systems, acts as a tumor suppressor in vivo, and engages the MYC network in a functionally relevant manner. In histologic studies of the mice, Schreiber- Agus et al. (1998) focused particularly on organs that normally express high or sustained levels of Mxi1, e.g., brain, spleen, kidney, and liver,

and on tissue types that are susceptible to tumorigenesis when a putative tumor suppressor is lost from the 10q24-q26 region; for example, the spleen and thymus are susceptible to T- cell leukemia, the prostatic epithelium to prostate cancer, and the brain to glioblastoma multiforme when the 10q24- q26 region is mutated.

[15392] It is appreciated that the abovementioned animal model for MXI1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[15393] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15394] Prochownik, E. V.; Grove, L. E.; Deubler, D.; Zhu, X. L.; Stephenson, R. A.; Rohr, L. R.; Yin, X.; Brothman, A. R. : Commonly occurring loss and mutation of the MXI1 gene in prostate cancer. Genes Chromosomes Cancer 22: 295-304, 1998. ; and

[15395] Schreiber- Agus, N.; Meng, Y.; Hoang, T.; Hou, H., Jr.; Chen, K.; Greenberg, R.; Cordon- Cardo, C.; Lee, H.- W.; DePinho, R. A. : Role of Mxi1 in ageing organ systems and the regulation of.

[15396] Further studies establishing the function and utilities of

MXI1 are found in John Hopkins OMIM database record ID 600020, and in cited publications listed in Table 5, which are hereby incorporated by reference.Myosin, heavy polypeptide 10, non-muscle (MYH10, Accession XP_290747.1) is another GAM94 target gene, herein designated TARGET GENE. MYH10 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MYH10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYH10 BINDING SITE, designated SEQ ID:4996, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15397] Another function of GAM94 is therefore inhibition of Myosin, heavy polypeptide 10, non-muscle (MYH10, Accession XP_290747.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH10.

[15398] Myosin, light polypeptide kinase (MYLK, Accession NP_444256.1) is another GAM94 target gene, herein designated TARGET GENE. MYLK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MYLK, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYLK BINDING SITE, designated SEQ ID:786, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15399] Another function of GAM94 is therefore inhibition of Myosin, light polypeptide kinase (MYLK, Accession NP_444256.1), a gene which is involved in contraction of smooth muscle. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYLK.

[15400] The function of MYLK has been established by previous studies. The contraction of smooth muscle begins with the phosphorylation of the light chain of myosin (e.g., 160781), a reaction catalyzed by myosin light chain kinase that is itself activated by the binding of calcium-calmodulin (see OMIM Ref. No. 114180). This key enzyme in muscle contraction, which exists in both nonmuscle and smooth muscle isoforms, has been shown by immunohistology to be present in neurons and glia.

[15401]

[15402] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[15403] Potier, M.- C.; Chelot, E.; Pekarsky, Y.; Gardiner, K.; Rossier, J.; Turnell, W. G. : The human myosin light chain kinase (MLCK) from hippocampus: cloning, sequencing, expression, and localization to 3cen- q21. Genomics 29: 562- 570, 1995. ; and

[15404] Watterson, D. M.; Schavocky, J. P.; Guo, L.; Weiss, C.; Chlenski, A.; Shirinsky, V. P.; Van Eldik, L. J.; Haiech, J. : Analysis of the kinase- related protein gene found at human chromo.

[15405] Further studies establishing the function and utilities of MYLK are found in John Hopkins OMIM database record ID 600922, and in cited publications listed in Table 5, which are hereby incorporated by reference.Myosin, light polypeptide kinase (MYLK, Accession NP_444255.1) is another GAM94 target gene, herein designated TARGET GENE. MYLK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MYLK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYLK BINDING SITE,

designated SEQ ID:786, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15406] Another function of GAM94 is therefore inhibition of Myosin, light polypeptide kinase (MYLK, Accession NP_444255.1), a gene which is involved in contraction of smooth muscle. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYLK.

[15407] The function of MYLK has been established by previous studies. The contraction of smooth muscle begins with the phosphorylation of the light chain of myosin (e.g., 160781), a reaction catalyzed by myosin light chain kinase that is itself activated by the binding of calcium-calmodulin (see OMIM Ref. No. 114180). This key enzyme in muscle contraction, which exists in both nonmuscle and smooth muscle isoforms, has been shown by immunohistology to be present in neurons and glia.

[15447] Further studies establishing the function and utilities of MYLK are found in John Hopkins OMIM database record ID 600922, and in cited publications listed in Table 5, which are hereby incorporated by reference.Myosin, light polypeptide kinase (MYLK, Accession NP_444257.1) is another GAM94 target gene, herein designated TARGET GENE. MYLK BINDING SITE is a target binding site found in

the 3` untranslated region of multiple transcripts of mRNA encoded by MYLK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYLK BINDING SITE, designated SEQ ID:786, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15448] Another function of GAM94 is therefore inhibition of Myosin, light polypeptide kinase (MYLK, Accession NP_444257.1), a gene which is involved in contraction of smooth muscle. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYLK.

[15449] The function of MYLK has been established by previous studies. The contraction of smooth muscle begins with the phosphorylation of the light chain of myosin (e.g., 160781), a reaction catalyzed by myosin light chain kinase that is itself activated by the binding of calcium-calmodulin (see OMIM Ref. No. 114180). This key enzyme in muscle contraction, which exists in both nonmuscle and smooth muscle isoforms, has been shown by immunohistology to be present in neurons and glia.

[15450]

[15451] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15452] Potier, M.- C.; Chelot, E.; Pekarsky, Y.; Gardiner, K.; Rossier, J.; Turnell, W. G. : The human myosin light chain kinase (MLCK) from hippocampus: cloning, sequencing, expression, and localization to 3cen- q21. Genomics 29: 562- 570, 1995. ; and

[15453] Watterson, D. M.; Schavocky, J. P.; Guo, L.; Weiss, C.; Chlenski, A.; Shirinsky, V. P.; Van Eldik, L. J.; Haiech, J. : Analysis of the kinase- related protein gene found at human chromo.

[15454] Further studies establishing the function and utilities of MYLK are found in John Hopkins OMIM database record ID 600922, and in cited publications listed in Table 5, which are hereby incorporated by reference.Myosin, light polypeptide kinase (MYLK, Accession NP_444253.1) is another GAM94 target gene, herein designated TARGET GENE. MYLK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MYLK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYLK BINDING SITE, designated SEQ ID:786, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15455] Another function of GAM94 is therefore inhibition of Myosin, light polypeptide kinase (MYLK, Accession NP_444253.1), a gene which is involved in contraction of smooth muscle. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYLK.

[15456] The function of MYLK has been established by previous studies. The contraction of smooth muscle begins with the phosphorylation of the light chain of myosin (e.g., 160781), a reaction catalyzed by myosin light chain kinase that is itself activated by the binding of calcium-calmodulin (see OMIM Ref. No. 114180). This key enzyme in muscle contraction, which exists in both nonmuscle and smooth muscle isoforms, has been shown by immunohistology to be present in neurons and glia.

[15457]

[15458] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[15459] Potier, M.- C.; Chelot, E.; Pekarsky, Y.; Gardiner, K.; Rossier, J.; Turnell, W. G. : The human myosin light chain kinase (MLCK) from hippocampus: cloning, sequencing, expression, and localization to 3cen- q21. Genomics 29: 562- 570, 1995. ; and

[15460] Watterson, D. M.; Schavocky, J. P.; Guo, L.; Weiss, C.; Chlenski, A.; Shirinsky, V. P.; Van Eldik, L. J.; Haiech, J. : Analysis of the kinase- related protein gene found at human chromo.

[15461] Further studies establishing the function and utilities of MYLK are found in John Hopkins OMIM database record ID 600922, and in cited publications listed in Table 5, which are hereby incorporated by reference.Myozenin 2 (MYOZ2, Accession NP_057683.1) is another GAM94 target gene, herein designated TARGET GENE. MYOZ2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MYOZ2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYOZ2 BINDING SITE, designated SEQ ID:7967, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:332.

[15462] Another function of GAM94 is therefore inhibition of Myozenin 2 (MYOZ2, Accession NP_057683.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYOZ2.

[15463] Neurofilament, heavy polypeptide 200kda (NEFH, Accession NP_066554.1) is another GAM94 target gene, herein designated TARGET GENE. NEFH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NEFH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NEFH BINDING SITE, designated SEQ ID:15071, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15464] Another function of GAM94 is therefore inhibition of Neurofilament, heavy polypeptide 200kda (NEFH, Accession NP_066554.1), a gene which is involved in the maintenance of neuronal caliber and in mature axons and therefore may be associated with Amyotrophic lateral sclerosis. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Amyotrophic lateral sclerosis, and of

other diseases and clinical conditions associated with NEFH.

[15465] The function of NEFH has been established by previous studies. See 162280. Mattei et al. (1988) used a rat cDNA probe coding for the C- terminal extension of the NFH gene to assign, by in situ hybridization, the human NFH gene to 22q12.1- q13.1. The possible implications of the fact that neurologic disorders such as meningioma map to this region were discussed. In the course of cloning the region between 2 markers, D22S212 and D22S32, that flank the NF2 (OMIM Ref. No. 101000) gene, Rouleau et al. (1993) identified a gene with a neuronal pattern of expression and a transcript size identical to that of NEFH. Use of NEFH cDNA confirmed the identity. There is compelling evidence that the NEFH locus is close to the NF2 locus. For example, Watson et al. (1993) found that the NEFH locus was hemizygous in a deletion that was observed in affected members of a family with NF2 and was estimated to be about 700 kb long. The NF2 locus has been positioned at 22q12.2. Bucan et al. (1993) mapped the homologous murine gene, which they symbolized Nfh, to chromosome 11. The tail of the heavy neurofilament subunit is composed of the repeating amino acid motif,

usually X- lysine- serine- proline- Y- lysine (OMIM Ref. No. XKSPYK), where X is a single amino acid and Y is 1 to 3 amino acids. There are 2 common polymorphic variants of 44 and 45 repeats. The tail probably regulates axonal caliber, with interfilament spacing determined by phosphorylation of the KSP motifs. According to Al- Chalabi et al. (1999), the polymorphic variants had been mislabeled in the published literature as 44 and 43 repeat variants, respectively, and therefore were referred to by them simply as long (L) and short (S) alleles.

[15466]

[15467] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15468] Al- Chalabi, A.; Andersen, P. M.; Nilsson, P.; Chioza, B.; Andersson, J. L.; Russ, C.; Shaw, C. E.; Powell, J. F.; Leigh, P. N. : Deletions of the heavy neurofilament subunit tail in amyotrophic lateral sclerosis. Hum. Molec. Genet. 8: 157-164, 1999. ; and

[15469] Watson, C. J.; Gaunt, L.; Evans, G.; Patel, K.; Harris, R.; Strachan, T. : A disease- associated germline deletion maps the type 2 neurofibromatosis (NF2) gene between the Ewing sarcoma.

[15470] Further studies establishing the function and utilities of NEFH are found in John Hopkins OMIM database record ID 162230, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sialidase 3 (membrane sialidase) (NEU3, Accession NP_006647.2) is another GAM94 target gene, herein designated TARGET GENE. NEU3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NEU3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NEU3 BINDING SITE, designated SEQ ID:18396, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15471] Another function of GAM94 is therefore inhibition of Sialidase 3 (membrane sialidase) (NEU3, Accession NP_006647.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEU3.

[15472] Nuclear factor (erythroid-derived 2), 45kda (NFE2, Accession NP_006154.1) is another GAM94 target gene, herein designated TARGET GENE. NFE2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by NFE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFE2 BINDING SITE, designated SEQ ID:6329, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15473] Another function of GAM94 is therefore inhibition of Nuclear factor (erythroid-derived 2), 45kda (NFE2, Accession NP_006154.1), a gene which regulates expression of the beta globin gene. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFE2.

[15474] The function of NFE2 has been established by previous studies. Peters et al. (1993) demonstrated that the Nfe2 gene in the mouse maps to chromosome 15 in a region containing the microcytic anemia (mk) gene. Homozygous mk mice were shown by Bannerman et al. (1972) to have defective intestinal iron transport and severe anemia. Peters et al. (1993) demonstrated Nfe2 expression in the mouse small intestine and NF- E2 binding activity in nuclear extracts of a human colon carcinoma cell line (OMIM Ref. No. Caco- 2). Caco- 2 cells possess properties of the small intestine, including the ability to transport iron.

These data together indicated that NF- E2 plays a role in all aspects of hemoglobin production: globin synthesis, heme synthesis, and the procurement of iron. (NF- E2 recognition sites are present not only in the locus control regions of the globin genes but also in the gene promoters of 2 heme biosynthetic enzymes, porphobilinogen deaminase (OMIM Ref. No. 176000) and ferrochelatase (OMIM Ref. No. 177000).) The 45- kD subunit of the human globin locus control region binding protein, NFE2, was cloned by homology to the murine gene. Immunoprecipitation experiments demonstrated in vivo association of the p45 subunit with an 18- kD protein (see OMIM Ref. No. MAFG, 602020, and MAFK, 600197). Because bZIP proteins bind DNA as dimers, it is likely that native NFE2 is a heterodimer of 45- and 18- kD subunits. By fluorescence in situ hybridization, Weremowicz et al. (1993) assigned the p45 subunit of NFE2 to 12q13. Chan et al. (1993) likewise cloned the human homolog of mouse NF-E2. Extensive survey of human tissue samples found that NFE2 expression is not limited to erythropoietic organs. Expression in the colon and testis suggested that NFE2 may participate in the regulation of genes other than globin

[15475]

[15476] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15477] Shivdasani, R. A.; Rosenblatt, M. F.; Zucker- Franklin, D.; Jackson, C. W.; Hunt, P.; Saris, C. J. M.; Orkin, S. H. : Transcription factor NF- E2 is required for platelet formation independent of the actions of thrombopoietin/MGDF in megakaryocyte development. Cell 81: 695- 704, 1995. ; and

[15478] Weremowicz, S.; Andrews, N. C.; Orkin, S. H.; Morton, C. C. : Mapping the p45 subunit of human NFE2 to 12q13. (Abstract) Human Genome Mapping Workshop 93 25, 1993.

[15479] Further studies establishing the function and utilities of NFE2 are found in John Hopkins OMIM database record ID 601490, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nuclear factor i/b (NFIB, Accession NP_005587.1) is another GAM94 target gene, herein designated TARGET GENE. NFIB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NFIB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFIB BINDING SITE, designated SEQ ID:9068, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15480] Another function of GAM94 is therefore inhibition of Nuclear factor i/b (NFIB, Accession NP_005587.1), a gene which recognizes and binds the palindromic sequence 5'- ttggcnnnnngccaa- 3' present in viral and cellular promoters. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFIB.

[15481] The function of NFIB has been established by previous studies. See nuclear factor I/A (NFIA; 600727). Qian et al. (1995) mapped the NFIB gene to chromosome 9p24.1 by fluorescence in situ hybridization. Approximately 12% of all pleomorphic adenomas of the salivary glands are characterized by chromosome aberrations involving 12q13- q15. Several chromosomes have been found as translocation partners of chromosome 12, and some of these are recurrent. The target gene on 12q13- q15 involved in the translocation is HMGIC (OMIM Ref. No. 600698). Fusion partner genes include LPP (OMIM Ref. No. 600700) on 3q,

ALDH2 (OMIM Ref. No. 100650) on 12q24.1, and FHIT (OMIM Ref. No. 601153) on 3p. Using 3- prime- RACE analysis of a primary adenoma with an apparently normal karyotype, Geurts et al. (1998) found an HMGIC fusion transcript containing ectopic sequences derived from the NFIB gene. In a second adenoma with an ins(9;12)(p23;q12q15) as the sole anomaly, they also found an HMGIC/NFIB hybrid transcript. Nucleotide sequence analysis of the fusion transcripts indicated that the genetic aberration in both tumors resulted in the replacement of a carboxy- terminal segment of HMGIC by the last 5 amino acids of NFIB

[15482]

[15483] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15484] Geurts, J. M. W.; Schoenmakers, E. F. P. M.; Roijer, E.; Astrom, A.- K.; Stenman, G.; van de Ven, W. J. M. : Identification of NFIB as recurrent translocation partner gene of HMGIC in pleomorphic adenomas. Oncogene 16: 865-872, 1998. ; and

[15485] Qian, F.; Kruse, U.; Lichter, P.; Sippel, A. E. : Chromosomal localization of the four genes (NFIA, B, C, and X) for the

human transcription factor nuclear factor I by FISH. Genomics 28.

[15486] Further studies establishing the function and utilities of NFIB are found in John Hopkins OMIM database record ID 600728, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nucleolar protein 3 (apoptosis repressor with card domain) (NOL3, Accession NP_003937.1) is another GAM94 target gene, herein designated TARGET GENE. NOL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NOL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NOL3 BINDING SITE, designated SEQ ID:13717, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15487] Another function of GAM94 is therefore inhibition of Nucleolar protein 3 (apoptosis repressor with card domain) (NOL3, Accession NP_003937.1), a gene which inhibits CASP2 and CASP8 and interacts with splicing factors. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOL3.

[15488] The function of NOL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Nuclear receptor subfamily 1, group h, member 2 (NR1H2, Accession NP_009052.1) is another GAM94 target gene, herein designated TARGET GENE. NR1H2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NR1H2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NR1H2 BINDING SITE, designated SEQ ID:14187, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15489] Another function of GAM94 is therefore inhibition of Nuclear receptor subfamily 1, group h, member 2 (NR1H2, Accession NP_009052.1), a gene which binds preferentially to double- stranded oligonucleotide direct repeats . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR1H2.

[15490] The function of NR1H2 has been established by previous studies. The LX receptors (LXRs) were originally identified

as orphan members of the nuclear receptor superfamily because their ligands were unknown. Like other receptors in the family, LXRs heterodimerize with retinoid X receptor (see OMIM Ref. No. 180245) and bind to specific response elements (LXREs) characterized by direct repeats separated by 4 nucleotides. Two genes, alpha (LXRA, 602423) and beta, are known to encode LXR proteins (Song et al., 1995).

[15491] Animal model experiments lend further support to the function of NR1H2. Repa et al. (2002) presented evidence for the direct control of the ATP- binding cassette sterol transporters Abca1 (OMIM Ref. No. 600046), Abcg5 (OMIM Ref. No. 605459), and Abcg8 (OMIM Ref. No. 605460) by the liver X receptors. The intensity of hepatic and jejunal staining for Abcg5/g8 and Abca1 was increased in normal mice fed cholesterol or other Lxr agonists. Cholesterol feeding resulted in upregulation of Abcg5 and Abcg8 in the Lxrb null mice, but not in the Lxra null or double knockout mice, suggesting that Lxra is required for sterol upregulation of Abcg5/g8 in this model. In a rat hepatoma cell line, Lxr- dependent transcription of the Abcg5/g8 genes was cycloheximide- resistant, indicating that these genes are directly regulated by the liver X re-

ceptors.

[15492] It is appreciated that the abovementioned animal model for NR1H2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[15493] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15494] Repa, J. J.; Berge, K. E.; Pomajzl, C.; Richardson, J. A.; Hobbs, H.; Mangelsdorf, D. J. : Regulation of ATP- binding cassette sterol transporters ABCG5 and ABCG8 by the liver X receptors alpha and beta. J. Biol. Chem. 277: 18793-18800, 2002. ; and

[15496] Further studies establishing the function and utilities of NR1H2 are found in John Hopkins OMIM database record ID 600380, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nuclear receptor subfamily 4, group a, member 3 (NR4A3, Accession NP_775290.1) is another GAM94 target gene, herein des-

ignated TARGET GENE. NR4A3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by NR4A3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NR4A3 BINDING SITE, designated SEQ ID:15634, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15497] Another function of GAM94 is therefore inhibition of Nuclear receptor subfamily 4, group a, member 3 (NR4A3, Accession NP_775290.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR4A3.

[15498] Netrin 4 (NTN4, Accession NP_067052.1) is another GAM94 target gene, herein designated TARGET GENE. NTN4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NTN4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NTN4 BINDING SITE, designated SEQ ID:4071, to the nucleotide sequence of GAM94 RNA, herein designated GAM

RNA, also designated SEQ ID:332.

[15499] Another function of GAM94 is therefore inhibition of Netrin 4 (NTN4, Accession NP_067052.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTN4.

[15500] Nucleoporin 54kda (NUP54, Accession NP_059122.2) is another GAM94 target gene, herein designated TARGET GENE. NUP54 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NUP54, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUP54 BINDING SITE, designated SEQ ID:16346, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15501] Another function of GAM94 is therefore inhibition of Nucleoporin 54kda (NUP54, Accession NP_059122.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP54.

[15502] NX17 (Accession NP_065716.1) is another GAM94 target gene, herein designated TARGET GENE. NX17 BINDING

SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NX17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NX17 BINDING SITE, designated SEQ ID:14516, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15503] Another function of GAM94 is therefore inhibition of NX17 (Accession NP_065716.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NX17.

[15504] Nyctalopin (NYX, Accession NP_072089.1) is another GAM94 target gene, herein designated TARGET GENE. NYX BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NYX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NYX BINDING SITE, designated SEQ ID:8632, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15505] Another function of GAM94 is therefore inhibition of Nyc-

talopin (NYX, Accession NP_072089.1), a gene which functions as the von willebrand factor receptor and mediates von willebrand factor- dependent platelet adhesion to blood vessels. the adhesion of platelets to injured vascular surfaces in the arterial circulation is a critical initiating event in hemostasis (by similarity). and therefore is associated with X- linked complete congenital stationary night blindness. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of X- linked complete congenital stationary night blindness, and of other diseases and clinical conditions associated with NYX.

[15506] The function of NYX has been established by previous studies. By positional cloning and the candidate gene approach, directed at the elucidation of the defect in complete congenital stationary night blindness (CSNB1; 310500), Bech- Hansen et al. (2000) identified a novel gene, NYX, that encodes a protein (nyctalopin) of 481 amino acids. Nyctalopin shows sequence similarity with members of the superfamily of proteins containing tandem arrays of the leucine- rich repeat (LRR) motif, as well as other features qualifying the protein as a member of the subfamily of small leucine- rich proteoglycans (SLRPs). By PCR amplification of tissue- specific cDNA, Bech-

Hansen et al. (2000) detected expression of NYX in retina and kidney only. In the retina it appeared to be expressed in photoreceptors, bipolar and amacrine interneurons, and ganglion cells. Pusch et al. (2000) likewise detected 14 different mutations. In 3 families the gene was partially deleted. They found expression of the gene at low levels in retina, brain, testis, and muscle.

[15507]

[15508] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15509] Bech- Hansen, N. T.; Naylor, M. J.; Maybaum, T. A.; Sparkes, R. L.; Koop, B.; Birch, D. G.; Bergen, A. A. B.; Prinsen, C. F. M.; Polomeno, R. C.; Gal, A.; Drack, A. V.; Musarella, M. A.; Jacobson, S. G.; Young, R. S. L.; Weleber, R. G. : Mutations in NYX, encoding the leucine- rich proteoglycan nyctalopin, cause X- linked complete congenital stationary night blindness. Nature Genet. 26: 319- 323, 2000. ; and

[15511] Further studies establishing the function and utilities of

NYX are found in John Hopkins OMIM database record ID 300278, and in cited publications listed in Table 5, which are hereby incorporated by reference.Oxysterol binding protein-like 11 (OSBPL11, Accession NP_073613.2) is another GAM94 target gene, herein designated TARGET GENE. OSBPL11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OSBPL11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL11 BINDING SITE, designated SEQ ID:7034, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15512] Another function of GAM94 is therefore inhibition of Oxysterol binding protein-like 11 (OSBPL11, Accession NP_073613.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL11.

[15513] Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663160.1) is another GAM94 target gene, herein designated TARGET GENE. OSBPL3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL3, correspond-

ing to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:6630, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15514] Another function of GAM94 is therefore inhibition of Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663160.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3.

[15515] Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663161.1) is another GAM94 target gene, herein designated TARGET GENE. OSBPL3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:6630, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15516] Another function of GAM94 is therefore inhibition of

Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663161.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3.

[15517] Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663164.1) is another GAM94 target gene, herein designated TARGET GENE. OSBPL3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:6630, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15518] Another function of GAM94 is therefore inhibition of Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663164.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3.

[15519] Oxysterol binding protein-like 3 (OSBPL3, Accession NP_056365.1) is another GAM94 target gene, herein designated TARGET GENE. OSBPL3 BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:6630, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15520] Another function of GAM94 is therefore inhibition of Oxysterol binding protein-like 3 (OSBPL3, Accession NP_056365.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3.

[15521] Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663162.1) is another GAM94 target gene, herein designated TARGET GENE. OSBPL3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:6630, to the nucleotide sequence of GAM94 RNA, herein designated GAM

RNA, also designated SEQ ID:332.

[15522] Another function of GAM94 is therefore inhibition of Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663162.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3.

[15523] Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663163.1) is another GAM94 target gene, herein designated TARGET GENE. OSBPL3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:6630, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15524] Another function of GAM94 is therefore inhibition of Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663163.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3.

[15525] Orthodenticle homolog 1 (drosophila) (OTX1, Accession

NP_055377.1) is another GAM94 target gene, herein designated TARGET GENE. OTX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OTX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OTX1 BINDING SITE, designated SEQ ID:2466, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15526] Another function of GAM94 is therefore inhibition of Orthodenticle homolog 1 (drosophila) (OTX1, Accession NP_055377.1), a gene which plays a role in the development of the brain and the sense organs. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OTX1.

[15527] The function of OTX1 has been established by previous studies. OTX1 is a homeobox family gene related to a gene expressed in the developing Drosophila head termed 'orthodenticle.' Simeone et al. (1992) identified rodent OTX2 (OMIM Ref. No. 600037). A homolog is also found in the zebrafish. Tissue expression of OTX1 is similar to that of OTX2 but is more restricted (Boncinelli et al., 1993).

Frantz et al. (1994) showed that Otx1 mRNA was expressed by precursors of deep- layer neurons within cortical layers 5 and 6 of the rat brain during both postnatal and adult life. Using a cosmid containing the gene, Kastury et al. (1994) mapped human OTX1 to 2p13 by fluorescence in situ hybridization, near the locus for EMX1 (OMIM Ref. No. 600034).

[15528] Animal model experiments lend further support to the function of OTX1. Acampora et al. (1996) produced null mice by replacing Otx1 with the lacZ gene. Otx - /- mice exhibited epileptic behavior with the characteristics of both focal and generalized seizures. Anatomic and histologic analyses of brains from 2- 4- month- old Otx - /- mice revealed multiple abnormalities affecting mainly the telencephalic, temporal, and perirhinal areas, the hippocampus, mesencephalon, and cerebellum, and the acoustic and visual sense organs. Acampora et al. (1996) reported that in older Otx - /- mice the epileptic behavior and frequency of seizures were somewhat reduced, although they never disappeared. They detected neither epileptic behavior nor electrical seizures in Otx+(/-) mice. The authors stated that this study provides the first evidence that loss of function of a homeobox- containing

gene affects brain development and induces spontaneous epilepsy.

[15529] It is appreciated that the abovementioned animal model for OTX1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[15530] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15531] Frantz, G. D.; Weimann, J. M.; Levin, M. E.; McConnell, S. K. : Otx1 and Otx2 define layers and regions in developing cerebral cortex and cerebellum. J. Neurosci. 14: 5725-5740, 1994. ; and

[15532] Acampora, D.; Mazan, S.; Avantaggiato, V.; Barone, P.; Tuorto, F.; Lallemand, Y.; Brulet, P.; Simeone, A. : Epilepsy and brain abnormalities in mice lacking the Otx1 gene. Nature Genet.

[15533] Further studies establishing the function and utilities of OTX1 are found in John Hopkins OMIM database record ID 600036, and in cited publications listed in Table 5, which are hereby incorporated by reference.P21(cdkn1a)-activated kinase 7 (PAK7, Accession NP_817127.1) is another GAM94 target gene, herein des-

ignated TARGET GENE. PAK7 BINDING SITE1 through PAK7 BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PAK7, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAK7 BINDING SITE1 through PAK7 BINDING SITE3, designated SEQ ID:15289, SEQ ID:12660 and SEQ ID:12660 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15534] Another function of GAM94 is therefore inhibition of P21(cdkn1a)-activated kinase 7 (PAK7, Accession NP_817127.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK7.

[15535] P21(cdkn1a)-activated kinase 7 (PAK7, Accession NP_065074.1) is another GAM94 target gene, herein designated TARGET GENE. PAK7 BINDING SITE1 through PAK7 BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PAK7, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Ta-

ble 4 illustrates the complementarity of the nucleotide sequences of PAK7 BINDING SITE1 through PAK7 BINDING SITE3, designated SEQ ID:2124, SEQ ID:15289 and SEQ ID:2124 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15536] Another function of GAM94 is therefore inhibition of P21(cdkn1a)-activated kinase 7 (PAK7, Accession NP_065074.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK7.

[15537] Poly(a) polymerase beta (testis specific) (PAPOLB, Accession NP_064529.2) is another GAM94 target gene, herein designated TARGET GENE. PAPOLB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PAPOLB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAPOLB BINDING SITE, designated SEQ ID:2613, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15538] Another function of GAM94 is therefore inhibition of

Poly(a) polymerase beta (testis specific) (PAPOLB, Accession NP_064529.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAPOLB.

[15539] Paired box gene 2 (PAX2, Accession NP_003978.1) is another GAM94 target gene, herein designated TARGET GENE. PAX2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PAX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE, designated SEQ ID:17177, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15540] Another function of GAM94 is therefore inhibition of Paired box gene 2 (PAX2, Accession NP_003978.1), a gene which involves in kidney cell differentiation and therefore is associated with Renal- coloboma syndrome. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Renal- coloboma syndrome, and of other diseases and clinical conditions associated with PAX2.

[15541] The function of PAX2 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Paired box gene 2 (PAX2, Accession NP_000269.1) is another GAM94 target gene, herein designated TARGET GENE. PAX2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PAX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE, designated SEQ ID:17177, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15542] Another function of GAM94 is therefore inhibition of Paired box gene 2 (PAX2, Accession NP_000269.1), a gene which involves in kidney cell differentiation and therefore is associated with Renal- coloboma syndrome. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Renal- coloboma syndrome, and of other diseases and clinical conditions associated with PAX2.

[15543] The function of PAX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM47.1.Paired box gene 2 (PAX2, Accession NP_003980.1) is another GAM94 target gene, herein designated TARGET GENE. PAX2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PAX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE, designated SEQ ID:17177, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15544] Another function of GAM94 is therefore inhibition of Paired box gene 2 (PAX2, Accession NP_003980.1), a gene which involves in kidney cell differentiation and therefore is associated with Renal- coloboma syndrome. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Renal- coloboma syndrome, and of other diseases and clinical conditions associated with PAX2.

[15545] The function of PAX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Paired box gene 2 (PAX2, Accession NP_003981.1) is another GAM94 target gene, herein des-

ignated TARGET GENE. PAX2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PAX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE, designated SEQ ID:17177, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15546] Another function of GAM94 is therefore inhibition of Paired box gene 2 (PAX2, Accession NP_003981.1), a gene which involves in kidney cell differentiation and therefore is associated with Renal- coloboma syndrome. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Renal- coloboma syndrome, and of other diseases and clinical conditions associated with PAX2.

[15547] The function of PAX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Paired box gene 2 (PAX2, Accession NP_003979.1) is another GAM94 target gene, herein designated TARGET GENE. PAX2 BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by PAX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE, designated SEQ ID:17177, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15548] Another function of GAM94 is therefore inhibition of Paired box gene 2 (PAX2, Accession NP_003979.1), a gene which involves in kidney cell differentiation and therefore is associated with Renal- coloboma syndrome. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Renal- coloboma syndrome, and of other diseases and clinical conditions associated with PAX2.

[15549] The function of PAX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Paired box gene 7 (PAX7, Accession NP_002575.1) is another GAM94 target gene, herein designated TARGET GENE. PAX7 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PAX7, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX7 BINDING SITE, designated SEQ ID:17455, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15550] Another function of GAM94 is therefore inhibition of Paired box gene 7 (PAX7, Accession NP_002575.1), a gene which involves in myogenesis and therefore is associated with Rhabdomyosarcoma- 2. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Rhabdomyosarcoma- 2, and of other diseases and clinical conditions associated with PAX7.

[15551] The function of PAX7 has been established by previous studies. In a review of 28 published cases of the pediatric soft tissue cancer alveolar rhabdomyosarcoma (OMIM Ref. No. 268220), Whang- Peng et al. (1992) found a characteristic t(2;13)(q35;q14) translocation and a variant t(1;13)(p36;q14) translocation in 64% and 18% of the cases, respectively. Subsequent molecular biology studies demonstrated that these translocations fuse the PAX3 gene (OMIM Ref. No. 193500) on chromosome 2 or the PAX7 gene on chromosome 1 with the forkhead in rhabdomyosarcoma gene (OMIM Ref. No. 136533) on chromo-

some 13 to generate PAX3/FKHR or PAX7/FKHR fusion genes. These genes encode chimeric transcription factors which, in the case of PAX3/FKHR, was shown to activate excessively transcription from binding targets of the wild-type PAX3 transcription factor. Using FISH, RT- PCR, and quantitative Southern blot analyses, Barr et al. (1996) demonstrated that these fusion genes are amplified in 20% of fusion- positive tumors. In particular, they found in vivo amplification of these fusions in 1 of 22 PAX3/FKHR- positive cases and 5 of 7 PAX7/FKHR- positive cases. By representational difference analysis, Seale et al. (2000) isolated mouse Pax7 as a gene specifically expressed in cultured satellite cell- derived myoblasts. In situ hybridization revealed that Pax7 is also expressed in satellite cells residing in adult muscle. Cell culture and electron microscopic analysis showed a complete absence of satellite cells in Pax7 - /- skeletal muscle. Surprisingly, fluorescence- activated cell sorting analysis indicated that the proportion of muscle- derived stem cells was unaffected. Stem cells from Pax7 - /- muscle displayed an almost 10- fold increase in their ability to form hematopoietic colonies. These results demonstrated that satellite cells and muscle- derived stem cells represent distinct cell

populations. Furthermore, these studies suggested that induction of Pax7 in muscle- derived stem cells induces satellite cell specification by restricting alternate developmental programs.

[15552] Animal model experiments lend further support to the function of PAX7. By representational difference analysis, Seale et al. (2000) isolated mouse Pax7 as a gene specifically expressed in cultured satellite cell- derived myoblasts. In situ hybridization revealed that Pax7 is also expressed in satellite cells residing in adult muscle. Cell culture and electron microscopic analysis showed a complete absence of satellite cells in Pax7 - /- skeletal muscle. Surprisingly, fluorescence- activated cell sorting analysis indicated that the proportion of muscle- derived stem cells was unaffected. Stem cells from Pax7 - /- muscle displayed an almost 10- fold increase in their ability to form hematopoietic colonies. These results demonstrated that satellite cells and muscle- derived stem cells represent distinct cell populations. Furthermore, these studies suggested that induction of Pax7 in muscle- derived stem cells induces satellite cell specification by restricting alternate developmental programs.

[15553] It is appreciated that the abovementioned animal model

for PAX7 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[15554] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15555] Barr, F. G.; Nauta, L. E.; Davis, R. J.; Schafer, B. W.; Nycum, L. M.; Biegel, J. A. : In vivo amplification of the PAX3-FKHR and PAX7- FKHR fusion genes in alveolar rhabdomyosarcoma. Hum. Molec. Genet. 5: 15- 21, 1996. ; and

[15556] Seale, P.; Sabourin, L. A.; Girgis- Gabardo, A.; Mansouri, A.; Gruss, P.; Rudnicki, M. A. : Pax7 is required for the specification of myogenic satellite cells. Cell 102: 777-786, 2000.

[15557] Further studies establishing the function and utilities of PAX7 are found in John Hopkins OMIM database record ID 167410, and in cited publications listed in Table 5, which are hereby incorporated by reference.Paired box gene 7 (PAX7, Accession NP_039236.1) is another GAM94 target gene, herein designated TARGET GENE. PAX7 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PAX7,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAX7 BINDING SITE, designated SEQ ID:17455, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15558] Another function of GAM94 is therefore inhibition of Paired box gene 7 (PAX7, Accession NP_039236.1), a gene which involves in myogenesis and therefore is associated with Rhabdomyosarcoma- 2. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Rhabdomyosarcoma- 2, and of other diseases and clinical conditions associated with PAX7.

[15559] The function of PAX7 has been established by previous studies. In a review of 28 published cases of the pediatric soft tissue cancer alveolar rhabdomyosarcoma (OMIM Ref. No. 268220), Whang- Peng et al. (1992) found a characteristic t(2;13)(q35;q14) translocation and a variant t(1;13)(p36;q14) translocation in 64% and 18% of the cases, respectively. Subsequent molecular biology studies demonstrated that these translocations fuse the PAX3 gene (OMIM Ref. No. 193500) on chromosome 2 or the PAX7 gene on chromosome 1 with the forkhead in rhab-

domyosarcoma gene (OMIM Ref. No. 136533) on chromosome 13 to generate PAX3/FKHR or PAX7/FKHR fusion genes. These genes encode chimeric transcription factors which, in the case of PAX3/FKHR, was shown to activate excessively transcription from binding targets of the wild-type PAX3 transcription factor. Using FISH, RT- PCR, and quantitative Southern blot analyses, Barr et al. (1996) demonstrated that these fusion genes are amplified in 20% of fusion- positive tumors. In particular, they found in vivo amplification of these fusions in 1 of 22 PAX3/FKHR- positive cases and 5 of 7 PAX7/FKHR- positive cases. By representational difference analysis, Seale et al. (2000) isolated mouse Pax7 as a gene specifically expressed in cultured satellite cell- derived myoblasts. In situ hybridization revealed that Pax7 is also expressed in satellite cells residing in adult muscle. Cell culture and electron microscopic analysis showed a complete absence of satellite cells in Pax7 - /- skeletal muscle. Surprisingly, fluorescence- activated cell sorting analysis indicated that the proportion of muscle- derived stem cells was unaffected. Stem cells from Pax7 - /- muscle displayed an almost 10- fold increase in their ability to form hematopoietic colonies. These results demonstrated that satellite

cells and muscle- derived stem cells represent distinct cell populations. Furthermore, these studies suggested that induction of Pax7 in muscle- derived stem cells induces satellite cell specification by restricting alternate developmental programs.

[15560] Animal model experiments lend further support to the function of PAX7. By representational difference analysis, Seale et al. (2000) isolated mouse Pax7 as a gene specifically expressed in cultured satellite cell- derived myoblasts. In situ hybridization revealed that Pax7 is also expressed in satellite cells residing in adult muscle. Cell culture and electron microscopic analysis showed a complete absence of satellite cells in Pax7 - /- skeletal muscle. Surprisingly, fluorescence- activated cell sorting analysis indicated that the proportion of muscle- derived stem cells was unaffected. Stem cells from Pax7 - /- muscle displayed an almost 10- fold increase in their ability to form hematopoietic colonies. These results demonstrated that satellite cells and muscle- derived stem cells represent distinct cell populations. Furthermore, these studies suggested that induction of Pax7 in muscle- derived stem cells induces satellite cell specification by restricting alternate developmental programs.

[15561] It is appreciated that the abovementioned animal model for PAX7 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[15562] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15563] Barr, F. G.; Nauta, L. E.; Davis, R. J.; Schafer, B. W.; Nycum, L. M.; Biegel, J. A. : In vivo amplification of the PAX3-FKHR and PAX7- FKHR fusion genes in alveolar rhabdomyosarcoma. Hum. Molec. Genet. 5: 15- 21, 1996. ; and

[15564] Seale, P.; Sabourin, L. A.; Girgis- Gabardo, A.; Mansouri, A.; Gruss, P.; Rudnicki, M. A. : Pax7 is required for the specification of myogenic satellite cells. Cell 102: 777-786, 2000.

[15565] Further studies establishing the function and utilities of PAX7 are found in John Hopkins OMIM database record ID 167410, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protocadherin 10 (PCDH10, Accession NP_116586.1) is another GAM94 target gene, herein designated TARGET GENE. PCDH10 BINDING SITE is a target binding site found in the 5` untrans-

lated region of multiple transcripts of mRNA encoded by PCDH10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDH10 BINDING SITE, designated SEQ ID:11480, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15566] Another function of GAM94 is therefore inhibition of Protocadherin 10 (PCDH10, Accession NP_116586.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH10.

[15567] Protocadherin 10 (PCDH10, Accession NP_065866.1) is another GAM94 target gene, herein designated TARGET GENE. PCDH10 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PCDH10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDH10 BINDING SITE, designated SEQ ID:11480, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15568] Another function of GAM94 is therefore inhibition of Protocadherin 10 (PCDH10, Accession NP_065866.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH10.

[15569] PCF11 (Accession NP_056969.1) is another GAM94 target gene, herein designated TARGET GENE. PCF11 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PCF11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCF11 BINDING SITE, designated SEQ ID:6695, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15570] Another function of GAM94 is therefore inhibition of PCF11 (Accession NP_056969.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCF11.

[15571] Phosphodiesterase 4b, camp-specific (phosphodiesterase e4 dunce homolog, drosophila) (PDE4B, Accession NP_002591.1) is another GAM94 target gene, herein designated TARGET GENE. PDE4B BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by PDE4B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE4B BINDING SITE, designated SEQ ID:7674, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15572] Another function of GAM94 is therefore inhibition of Phosphodiesterase 4b, camp-specific (phosphodiesterase e4 dunce homolog, drosophila) (PDE4B, Accession NP_002591.1), a gene which may be involved in mediating central nervous system effects of therapeutic agents ranging from antidepressants to antiasthmatic and anti- inflammatory agents. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4B.

[15573] The function of PDE4B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.1.Phosphodiesterase 4c, camp-specific (phosphodiesterase e1 dunce homolog, drosophila) (PDE4C, Accession NP_000914.1) is another GAM94 target gene, herein designated TARGET GENE. PDE4C BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDE4C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE4C BINDING SITE, designated SEQ ID:14459, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15574] Another function of GAM94 is therefore inhibition of Phosphodiesterase 4c, camp-specific (phosphodiesterase e1 dunce homolog, drosophila) (PDE4C, Accession NP_000914.1), a gene which is a cAMP- specific phosphodiesterase and may be a protein involved in learning and memory. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4C.

[15575] The function of PDE4C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM65.1.PDZGEF1 (Accession NP_055062.1) is another GAM94 target gene, herein designated TARGET GENE. PDZGEF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDZGEF1,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDZGEF1 BINDING SITE, designated SEQ ID:15137, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15576] Another function of GAM94 is therefore inhibition of PDZGEF1 (Accession NP_055062.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZGEF1.

[15577] PDZK3 (Accession NP_835260.1) is another GAM94 target gene, herein designated TARGET GENE. PDZK3 BINDING SITE1 and PDZK3 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PDZK3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDZK3 BINDING SITE1 and PDZK3 BINDING SITE2, designated SEQ ID:13677 and SEQ ID:13677 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15578] Another function of GAM94 is therefore inhibition of

PDZK3 (Accession NP_835260.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZK3.

[15579] PDZK3 (Accession NP_055837.2) is another GAM94 target gene, herein designated TARGET GENE. PDZK3 BINDING SITE1 and PDZK3 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PDZK3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDZK3 BINDING SITE1 and PDZK3 BINDING SITE2, designated SEQ ID:4585 and SEQ ID:4585 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15580] Another function of GAM94 is therefore inhibition of PDZK3 (Accession NP_055837.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZK3.

[15581] Prefoldin 1 (PFDN1, Accession NP_002613.2) is another GAM94 target gene, herein designated TARGET GENE. PFDN1 BINDING SITE1 and PFDN1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA

encoded by PFDN1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PFDN1 BINDING SITE1 and PFDN1 BINDING SITE2, designated SEQ ID:6722 and SEQ ID:13206 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15582] Another function of GAM94 is therefore inhibition of Prefoldin 1 (PFDN1, Accession NP_002613.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFDN1.

[15583] Pan-hematopoietic expression (PHEMX, Accession NP_620592.1) is another GAM94 target gene, herein designated TARGET GENE. PHEMX BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PHEMX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PHEMX BINDING SITE, designated SEQ ID:12316, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15584] Another function of GAM94 is therefore inhibition of Pan-hematopoietic expression (PHEMX, Accession NP_620592.1), a gene which is an important tumor- suppressor gene region. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHEMX.

[15585] The function of PHEMX has been established by previous studies. Lee et al. (1999) noted that 7 imprinted genes had been identified on 11p15: IGF2 (OMIM Ref. No. 147470), which encodes an important autocrine growth factor in cancer; H19 (OMIM Ref. No. 103280), an untranslated RNA whose imprinting regulates IGF2; ASCL2 (OMIM Ref. No. 601886), a homolog of Drosophila achaete- scute that is expressed in the trophoblast; KCNQ1 (OMIM Ref. No. 192500), which encodes a voltage- gated potassium channel; p57(KIP2) (CDKN1C; 600856), which encodes a cyclin- dependent kinase inhibitor; TSSC5 (IMPT1; 602631), which encodes a predicted transmembrane transporter; and TSSC3 (OMIM Ref. No. 602131), also known as IPL, a homolog of a mouse apoptosis- inducing gene. With the exception of IGF2, all of these genes are expressed from the maternal allele. Because of the large number of imprinted genes on 11p15,

spanning approximately 1 Mb, this region appears to represent 1 of 2 known large imprinted domains in the human genome, the other being the Prader- Willi/Angelman syndrome domain of 15q11- q13 (see OMIM Ref. No. 105830). Koi et al. (1993) isolated a subchromosomal transferable fragment (STF) that suppresses in vitro growth of the rhabdomyosarcoma cell line RD, confirming the existence of 1 or more tumor suppressor genes within this region. Hu et al. (1997) found that the STF spans approximately 2.5 Mb, with D11S12 at its proximal end and D11S1318 at its distal end. Within a cluster of imprinted genes in this STF, Lee et al. (1999) identified 2 novel genes, designated TSSC4 (OMIM Ref. No. 603852) and TSSC6, that were not imprinted in any of the fetal or extraembryonic tissues examined. The TSSC6 cDNA encodes a predicted protein of 290 amino acids that shows no close similarity to previously reported proteins. Northern blot analysis failed to detect TSSC6 gene expression; however, RT- PCR analysis suggested that the TSSC6 gene is ubiquitously expressed at low levels. The TSSC4 and TSSC6 genes are both located in the center of the 1- Mb imprinted domain on 11p15 that contains the 7 imprinted genes. Thus, the imprinted gene domain of 11p15 ap-

pears to contain at least 2 imprinted subdomains, between which the TSSC4 and TSSC6 genes substantially escape imprinting, due either to a lack of initial silencing or to an early developmental relaxation of imprinting

[15586]

[15587] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15589] Lee, M. P.; Brandenburg, S.; Landes, G. M.; Adams, M.; Miller, G.; Feinberg, A. P. : Two novel genes in the center of the 11p15 imprinted domain escape genomic imprinting. Hum. Molec. Ge.

[15590] Further studies establishing the function and utilities of PHEMX are found in John Hopkins OMIM database record ID 603853, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pan-hematopoietic expression (PHEMX, Accession NP_620591.1) is another GAM94 target gene, herein designated TARGET GENE. PHEMX BINDING SITE is a target

binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PHEMX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PHEMX BINDING SITE, designated SEQ ID:12316, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15591] Another function of GAM94 is therefore inhibition of Pan-hematopoietic expression (PHEMX, Accession NP_620591.1), a gene which is an important tumor- suppressor gene region. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHEMX.

[15592] The function of PHEMX has been established by previous studies. Lee et al. (1999) noted that 7 imprinted genes had been identified on 11p15: IGF2 (OMIM Ref. No. 147470), which encodes an important autocrine growth factor in cancer; H19 (OMIM Ref. No. 103280), an untranslated RNA whose imprinting regulates IGF2; ASCL2 (OMIM Ref. No. 601886), a homolog of Drosophila achaete- scute that is expressed in the trophoblast; KCNQ1 (OMIM Ref. No. 192500), which encodes a volt-

age- gated potassium channel; p57(KIP2) (CDKN1C; 600856), which encodes a cyclin- dependent kinase inhibitor; TSSC5 (IMPT1; 602631), which encodes a predicted transmembrane transporter; and TSSC3 (OMIM Ref. No. 602131), also known as IPL, a homolog of a mouse apoptosis- inducing gene. With the exception of IGF2, all of these genes are expressed from the maternal allele. Because of the large number of imprinted genes on 11p15, spanning approximately 1 Mb, this region appears to represent 1 of 2 known large imprinted domains in the human genome, the other being the Prader- Willi/Angelman syndrome domain of 15q11- q13 (see OMIM Ref. No. 105830). Koi et al. (1993) isolated a subchromosomal transferable fragment (STF) that suppresses in vitro growth of the rhabdomyosarcoma cell line RD, confirming the existence of 1 or more tumor suppressor genes within this region. Hu et al. (1997) found that the STF spans approximately 2.5 Mb, with D11S12 at its proximal end and D11S1318 at its distal end. Within a cluster of imprinted genes in this STF, Lee et al. (1999) identified 2 novel genes, designated TSSC4 (OMIM Ref. No. 603852) and TSSC6, that were not imprinted in any of the fetal or extraembryonic tissues examined. The TSSC6 cDNA encodes

a predicted protein of 290 amino acids that shows no close similarity to previously reported proteins. Northern blot analysis failed to detect TSSC6 gene expression; however, RT- PCR analysis suggested that the TSSC6 gene is ubiquitously expressed at low levels. The TSSC4 and TSSC6 genes are both located in the center of the 1- Mb imprinted domain on 11p15 that contains the 7 imprinted genes. Thus, the imprinted gene domain of 11p15 appears to contain at least 2 imprinted subdomains, between which the TSSC4 and TSSC6 genes substantially escape imprinting, due either to a lack of initial silencing or to an early developmental relaxation of imprinting

[15593]

[15594] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15595] Koi, M.; Johnson, L. A.; Kalikin, L. M.; Little, P. F. R.; Nakamura, Y.; Feinberg, A. P. : Tumor cell growth arrest caused by subchromosomal transferable DNA fragments from chromosome 11. Science 260: 361- 364, 1993. ; and

[15596] Lee, M. P.; Brandenburg, S.; Landes, G. M.; Adams, M.; Miller, G.; Feinberg, A. P. : Two novel genes in the center of the 11p15 imprinted domain escape genomic imprint-

ing. Hum. Molec. Ge.

[15597] Further studies establishing the function and utilities of PHEMX are found in John Hopkins OMIM database record ID 603853, and in cited publications listed in Table 5, which are hereby incorporated by reference.PHT2 (Accession NP_057666.1) is another GAM94 target gene, herein designated TARGET GENE. PHT2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PHT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PHT2 BINDING SITE, designated SEQ ID:13637, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15598] Another function of GAM94 is therefore inhibition of PHT2 (Accession NP_057666.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHT2.

[15599] Phosphatidylinositol-4-phosphate 5-kinase, type i, beta (PIP5K1B, Accession NP_003549.1) is another GAM94 target gene, herein designated TARGET GENE. PIP5K1B BINDING SITE is a target binding site found in the 5` untrans-

lated region of mRNA encoded by PIP5K1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIP5K1B BINDING SITE, designated SEQ ID:9155, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15600] Another function of GAM94 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, type i, beta (PIP5K1B, Accession NP_003549.1), a gene which catalyses the phosphorylation of phosphatidylinositol- 4- phosphate to form phosphatidylinositol- 4,5- biphosphate . and therefore may be associated with Friedreich ataxia. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Friedreich ataxia., and of other diseases and clinical conditions associated with PIP5K1B.

[15601] The function of PIP5K1B has been established by previous studies. Carvajal et al. (1995) reported the isolation of a gene from the region of the genome associated with Friedreich ataxia (FRDA; 229300). Expression was found to be complex, with multiple transcripts detected in a variety of tissues and evidence of alternative splicing and developmental control. The predicted amino acid se-

quence for the 2.7- kb transcript showed a marked homology to the deduced amino acid sequence of the MSS4 protein of Saccharomyces cerevisiae, which had been proposed to function in the phosphoinositide cycle, thus suggesting a potential role for the human homolog in signal transduction. Although no evidence of mutation was detected in the transcript, the sequence (which they designated STM7.I) represented only one of the shorter alternatively spliced species identified by Northern analysis and direct sequencing. Carvajal et al. (1996) reported that the X25 (frataxin- encoding) gene described by Campuzano et al. (1996) and shown to be associated with mutations in FRDA patients comprises part of a gene that they had previously identified and named STM7. They reported that the transcription of both STM7 and X25 occurs from the centromere toward the telomere, that the reported sequences of STM7 and X25 did not represent a full- length transcript, that multiple transcripts for each of these genes are present in Northern blots, and that several of these transcripts are of similar size. Carvajal et al. (1996) also reported that less than 10 kb separates the CpG island identified in the X25/exon 1 from the 3- prime end of STM7/exon 16. They further demonstrated that the re-

combinant protein corresponding to the STM7.1 transcript has phosphatidylinositol- 4- phosphate 5- kinase activity. See 606829 for further discussion of the relationship between STM7 and FRDA.

[15602]

[15603] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15604] Campuzano, V.; Montermini, L.; Molto, M. D.; Pianese, L.; Cossee, M.; Cavalcanti, F.; Monros, E.; Rodius, F.; Duclos, F.; Monticelli, A.; Zara, F.; Canizares, J.; Koutnikova, H.; Bidichandani, S. I.; Gellera, C.; Brice, A.; Trouillas, P.; De Michele, G.; Filla, A.; De Frutos, R.; Palau, F.; Patel, P. [15606] Further studies establishing the function and utilities of PIP5K1B are found in John Hopkins OMIM database record

ID 602745, and in cited publications listed in Table 5, which are hereby incorporated by reference.Phosphatidylserine decarboxylase (PISD, Accession NP_055153.1) is another GAM94 target gene, herein designated TARGET GENE. PISD BINDING SITE1 and PISD BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PISD, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PISD BINDING SITE1 and PISD BINDING SITE2, designated SEQ ID:19454 and SEQ ID:3283 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15607] Another function of GAM94 is therefore inhibition of Phosphatidylserine decarboxylase (PISD, Accession NP_055153.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PISD.

[15608] Paired-like homeodomain transcription factor 2 (PITX2, Accession NP_700475.1) is another GAM94 target gene, herein designated TARGET GENE. PITX2 BINDING SITE is a target binding site found in the 5` untranslated region of

multiple transcripts of mRNA encoded by PITX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PITX2 BINDING SITE, designated SEQ ID:3506, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15609] Another function of GAM94 is therefore inhibition of Paired-like homeodomain transcription factor 2 (PITX2, Accession NP_700475.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PITX2.

[15610] Paired-like homeodomain transcription factor 2 (PITX2, Accession NP_700476.1) is another GAM94 target gene, herein designated TARGET GENE. PITX2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PITX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PITX2 BINDING SITE, designated SEQ ID:3506, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15611] Another function of GAM94 is therefore inhibition of Paired-like homeodomain transcription factor 2 (PITX2, Accession NP_700476.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PITX2.

[15612] Pbx/knotted 1 homeobox 2 (PKNOX2, Accession NP_071345.1) is another GAM94 target gene, herein designated TARGET GENE. PKNOX2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PKNOX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PKNOX2 BINDING SITE, designated SEQ ID:2901, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15613] Another function of GAM94 is therefore inhibition of Pbx/knotted 1 homeobox 2 (PKNOX2, Accession NP_071345.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKNOX2.

[15614] Placenta-specific 3 (PLAC3, Accession NP_068755.1) is another GAM94 target gene, herein designated TARGET

GENE. PLAC3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PLAC3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLAC3 BINDING SITE, designated SEQ ID:12261, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15615] Another function of GAM94 is therefore inhibition of Placenta-specific 3 (PLAC3, Accession NP_068755.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC3.

[15616] Placenta-specific 3 (PLAC3, Accession NP_064714.1) is another GAM94 target gene, herein designated TARGET GENE. PLAC3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PLAC3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLAC3 BINDING SITE, designated SEQ ID:12261, to the nucleotide sequence of

GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15617] Another function of GAM94 is therefore inhibition of Placenta-specific 3 (PLAC3, Accession NP_064714.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC3.

[15618] Phospholipase c, delta 3 (PLCD3, Accession NP_588614.1) is another GAM94 target gene, herein designated TARGET GENE. PLCD3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLCD3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLCD3 BINDING SITE, designated SEQ ID:3472, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15619] Another function of GAM94 is therefore inhibition of Phospholipase c, delta 3 (PLCD3, Accession NP_588614.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLCD3.

[15620] Phospholipase c, delta 4 (PLCD4, Accession NP_116115.1)

is another GAM94 target gene, herein designated TARGET GENE. PLCD4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PLCD4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLCD4 BINDING SITE, designated SEQ ID:18501, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15621] Another function of GAM94 is therefore inhibition of Phospholipase c, delta 4 (PLCD4, Accession NP_116115.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLCD4.

[15622] Phospholipase c-like 2 (PLCL2, Accession NP_055999.1) is another GAM94 target gene, herein designated TARGET GENE. PLCL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PLCL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLCL2 BINDING SITE, designated SEQ ID:2076, to the nucleotide sequence of GAM94 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:332.

[15623] Another function of GAM94 is therefore inhibition of Phospholipase c-like 2 (PLCL2, Accession NP_055999.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLCL2.

[15624] Plexin a2 (PLXNA2, Accession NP_079455.1) is another GAM94 target gene, herein designated TARGET GENE. PLXNA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLXNA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLXNA2 BINDING SITE, designated SEQ ID:18949, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15625] Another function of GAM94 is therefore inhibition of Plexin a2 (PLXNA2, Accession NP_079455.1), a gene which is a transmembrane protein. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLXNA2.

[15626] The function of PLXNA2 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM65.1.Plexin b2 (PLXNB2, Accession NP_036533.1) is another GAM94 target gene, herein designated TARGET GENE. PLXNB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLXNB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLXNB2 BINDING SITE, designated SEQ ID:8876, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15627] Another function of GAM94 is therefore inhibition of Plexin b2 (PLXNB2, Accession NP_036533.1), a gene which is a novel member of the plexin family. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLXNB2.

[15628] The function of PLXNB2 has been established by previous studies. Using the technique of differential display, Shinoura et al. (1995) identified a cDNA fragment that was differentially expressed in malignant vs benign brain tumors. By screening a human fetal brain cDNA library with this fragment, they isolated a novel cDNA, which they

termed MM1. MM1 was expressed almost 8- fold higher in glioblastomas compared to low- grade astrocytomas and slightly higher in malignant menangiomas than in benign menangiomas. By screening human brain cDNAs for those encoding proteins larger than 60 kD, Nagase et al. (1997) identified the MM1 gene, which they called KIAA0315. By RT- PCR amplification starting from the partial cDNA sequences of clones MM1 and KIAA0315, Tamagnone et al. (1999) identified the cDNA sequence of a novel member of the plexin gene family and named the gene plexin B2. Using a radiation hybrid mapping panel, Nagase et al. (1997) mapped the PLXNB2 gene to chromosome 22. By sequence analysis, Tamagnone et al. (1999) showed that the PLXNB2 gene maps to 22q13.31- q13.33 in the BAC clone (GenBank AL022328) containing the MAPK12 (OMIM Ref. No. 602399) and MAPK11 (OMIM Ref. No. 602898) genes.

[15629]

[15630] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15631] Shinoura, N.; Shamraj, O. I.; Hugenholz, H.; Zhu, J. G.; McBlack, P.; Warnick, R.; Tew, J. J.; Wani, M. A.; Menon, A.

G. : Identification and partial sequence of a cDNA that is differentially expressed in human brain tumors. Cancer Lett. 89: 215- 221, 1995. ; and

[15632] Tamagnone, L.; Artigiani, S.; Chen, H.; He, Z.; Ming, G.; Song, H.; Chedotal, A.; Winberg, M. L.; Goodman, C. S.; Poo, M.; Tessier- Lavigne, M.; Comoglio, P. M. : Plexins are a large fam.

[15633] Further studies establishing the function and utilities of PLXNB2 are found in John Hopkins OMIM database record ID 604293, and in cited publications listed in Table 5, which are hereby incorporated by reference.Postmeiotic segregation increased 2-like 5 (PMS2L5, Accession NP_777590.1) is another GAM94 target gene, herein designated TARGET GENE. PMS2L5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PMS2L5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PMS2L5 BINDING SITE, designated SEQ ID:9051, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15634] Another function of GAM94 is therefore inhibition of Post-

meiotic segregation increased 2-like 5 (PMS2L5, Accession NP_777590.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMS2L5.

[15635] Paraneoplastic antigen like 5 (PNMA5, Accession NP_443158.1) is another GAM94 target gene, herein designated TARGET GENE. PNMA5 BINDING SITE1 through PNMA5 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by PNMA5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PNMA5 BINDING SITE1 through PNMA5 BINDING SITE3, designated SEQ ID:4787, SEQ ID:10336 and SEQ ID:12546 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15636] Another function of GAM94 is therefore inhibition of Paraneoplastic antigen like 5 (PNMA5, Accession NP_443158.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNMA5.

[15637] Polymerase (dna directed) kappa (POLK, Accession NP_057302.1) is another GAM94 target gene, herein des-

ignated TARGET GENE. POLK BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by POLK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POLK BINDING SITE, designated SEQ ID:7290, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15638] Another function of GAM94 is therefore inhibition of Polymerase (dna directed) kappa (POLK, Accession NP_057302.1), a gene which is necessary for chromosome segregation. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLK.

[15639] The function of POLK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Pou domain, class 3, transcription factor 2 (POU3F2, Accession NP_005595.1) is another GAM94 target gene, herein designated TARGET GENE. POU3F2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by POU3F2, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POU3F2 BINDING SITE, designated SEQ ID:19974, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15640] Another function of GAM94 is therefore inhibition of Pou domain, class 3, transcription factor 2 (POU3F2, Accession NP_005595.1), a gene which positively regulates the genes under the control of corticotropin- releasing hormone. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU3F2.

[15641] The function of POU3F2 has been established by previous studies. N- Oct- 3 is a protein belonging to a large family of transcription factors that bind to the octameric DNA sequence ATGCAAAT. Most of these proteins share a highly homologous region, referred to as the POU domain, which occurs in several mammalian transcription factors, including the octamer- binding proteins Oct1 (POU2F1; 164175) and Oct2 (POU2F2; 164176), and the pituitary protein Pit1 (PIT1; 173110). Class III POU genes are expressed predominantly in the CNS. It is likely that CNS-specific transcription factors such as these play an impor-

tant role in mammalian neurogenesis by regulating their diverse patterns of gene expression. The human counterpart of the mouse brain- 2 gene (Brn2) was first identified in nuclear extracts from brain and was termed N- Oct- 3 (Schreiber et al., 1993). The protein is expressed in the CNS during development and in adult brain. Atanasoski et al. (1995) reported the isolation, characterization, and chromosomal localization of the human POU3F2 gene which encodes the N- Oct- 3 protein. The gene is intronless. Sequencing of 650 bp of the promoter region showed 84% sequence identity of POU3F2 with the mouse Brn2 gene. By Southern blot analysis of somatic cell hybrids and by in situ hybridization, Atanasoski et al. (1995) mapped the POU3F2 gene to 6q16. Xia et al. (1993) mapped the Brn2 (OMIM Ref. No. Pou3f2) gene to mouse chromosome 4.

[15642]

[15643] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15644] Atanasoski, S.; Toldo, S. S.; Malipiero, U.; Schreiber, E.; Fries, R.; Fontana, A. : Isolation of the human genomic brain- 2/N- Oct 3 gene (POUF3) and assignment to chro-

mosome 6q16. Genomics 26: 272- 280, 1995. ; and

[15645] Xia, Y.- R.; Andersen, B.; Mehrabian, M.; Diep, A. T.; Warden, C. H.; Mohandas, T.; McEvilly, R. J.; Rosenfeld, M. G.; Lusis, A. J. : Chromosomal organization of mammalian POU domain factors.

[15646] Further studies establishing the function and utilities of POU3F2 are found in John Hopkins OMIM database record ID 600494, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ptprf interacting protein, binding protein 2 (liprin beta 2) (PPFIBP2, Accession XP_084578.4) is another GAM94 target gene, herein designated TARGET GENE. PPFIBP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PPFIBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPFIBP2 BINDING SITE, designated SEQ ID:10296, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15647] Another function of GAM94 is therefore inhibition of Ptprf interacting protein, binding protein 2 (liprin beta 2) (PPFIBP2, Accession XP_084578.4) . Accordingly, utilities

of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPFIBP2.

[15648] Protein phosphatase 1f (pp2c domain containing) (PPM1F, Accession NP_055449.1) is another GAM94 target gene, herein designated TARGET GENE. PPM1F BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPM1F, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPM1F BINDING SITE, designated SEQ ID:10074, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15649] Another function of GAM94 is therefore inhibition of Protein phosphatase 1f (pp2c domain containing) (PPM1F, Accession NP_055449.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPM1F.

[15650] Protein phosphatase 1, regulatory (inhibitor) subunit 11 (PPP1R11, Accession NP_740751.1) is another GAM94 target gene, herein designated TARGET GENE. PPP1R11 BINDING SITE1 and PPP1R11 BINDING SITE2 are target binding sites found in untranslated regions of multiple

transcripts of mRNA encoded by PPP1R11, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R11 BINDING SITE1 and PPP1R11 BINDING SITE2, designated SEQ ID:4808 and SEQ ID:8137 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15651] Another function of GAM94 is therefore inhibition of Protein phosphatase 1, regulatory (inhibitor) subunit 11 (PPP1R11, Accession NP_740751.1), a gene which inhibits rabbit muscle protein phosphatase- 1 in vitro . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R11.

[15652] The function of PPP1R11 has been established by previous studies. Using a cDNA selection technique to identify genes in the hemochromatosis (OMIM Ref. No. 235200) gene region on 6p21.3, El Kahloun et al. (1993) cloned PPP1R11, which they called HCGV (hemochromatosis candidate gene V). By screening cDNA libraries and using PCR techniques, Giffon et al. (1996) obtained a full- length cDNA encoding PPP1R11. The predicted 126- amino acid

PPP1R11 protein contains 8 potential phosphorylation sites and a C- terminal PEST pattern that is characteristic of proteins with short half- lives. PPP1R11 shares 89.7% amino acid identity with its mouse homolog, Tctex5. Northern blot analysis detected a 1.8- kb PPP1R11 transcript in all fetal and adult tissues tested. The PPP1R11 gene appeared to be widely preserved throughout animal evolution, and Giffon et al. (1996) detected fragments on the DNAs of primates, rat, dog, cow, and rabbit. By screening sequence databases, Lepourcelet et al. (1996) identified a cDNA clone that suggested the existence of at least 1 spliced isoform of PPP1R11. Using a yeast 2- hybrid screen to identify putative protein phosphatase- 1 (PP1; OMIM Ref. No. 176875)- binding proteins, Zhang et al. (1998) obtained a cDNA encoding PPP1R11, which they called inhibitor- 3. They reported that PPP1R11 is hydrophilic, heat stable, and behaves anomalously on SDS-PAGE, with an apparent molecular mass of 23 kD compared with its calculated molecular mass of 14 kD, and on gel filtration, with a relative molecular weight of 55,000. Zhang et al. (1998) showed that PPP1R11 is a specific inhibitor of PP1 with a differential sensitivity toward the metal- independent and metal- dependent forms of PP1.

They hypothesized that the PP1- binding ability of PPP1R11 is due at least in part to the possession of a VxW motif. PPP1R11 is well conserved in evolution, with related genes in S. cerevisiae, S. pombe, and C. elegans.

[15653]

[15661] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15662] Lepourcelet, M.; Andrieux, N.; Giffon, T.; Pichon, L.; Hampe, A.; Galibert, F.; Mosser, J. : Systematic sequencing of the human HLA- A/HLA- F region: establishment of a cosmid contig and identification of a new gene cluster within 37 kb of sequence. Genomics 37: 316- 326, 1996. ; and

[15663] Zhang, J.; Zhang, L.; Zhao, S.; Lee, E. Y. C. : Identification and characterization of the human HCG V gene product as a novel inhibitor of protein phosphatase- 1. Biochemistry 37: 16728.

[15664] Further studies establishing the function and utilities of

PPP1R11 are found in John Hopkins OMIM database record ID 606670, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein phosphatase 1, regulatory (inhibitor) subunit 3b (PPP1R3B, Accession NP_078883.1) is another GAM94 target gene, herein designated TARGET GENE. PPP1R3B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPP1R3B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R3B BINDING SITE, designated SEQ ID:16205, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15665] Another function of GAM94 is therefore inhibition of Protein phosphatase 1, regulatory (inhibitor) subunit 3b (PPP1R3B, Accession NP_078883.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3B.

[15666] Protein phosphatase 2 (formerly 2a), regulatory subunit a (pr 65), beta isoform (PPP2R1B, Accession NP_002707.2) is another GAM94 target gene, herein designated TARGET GENE. PPP2R1B BINDING SITE is a target binding site found

in the 5` untranslated region of mRNA encoded by PPP2R1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP2R1B BINDING SITE, designated SEQ ID:18668, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15667] Another function of GAM94 is therefore inhibition of Protein phosphatase 2 (formerly 2a), regulatory subunit a (pr 65), beta isoform (PPP2R1B, Accession NP_002707.2), a gene which is necessary for interaction of the catalytic PP2A- C and variable PP2A- B subunits. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R1B.

[15668] The function of PPP2R1B has been established by previous studies. Loss of heterozygosity (LOH) at 11q22- q24 has been associated with lung, colon, breast, cervical, head and neck, and ovarian cancers, as well as melanoma (Arai et al., 1996). Introduction of a normal chromosome 11, or a derivative t(X;11) chromosome containing 11pter- q23, can reverse the tumorigenic potential of several types of cancer cells and Wilms tumor when introduced into nude

mice. These studies suggest that one or more tumor suppressor genes are located centromeric to the t(X;11) breakpoint at 11q23. Because of a high frequency of LOH in lung cancer cells involving D11S1647 and D11S1987, Wang et al. (1998) systematically surveyed the region between these 2 markers for candidate tumor suppressor genes. Over 100 candidate genes and expressed sequenced tags (ESTs) were identified from a radiation hybrid map of chromosome 11 and from the NCBI transcript map. One of the EST sequences (OMIM Ref. No. M65254) corresponded to a subunit of the serine/threonine protein phosphatase 2A (PP2A). PP2A is an important regulatory enzyme that down regulates the mitogen- activated protein kinase (MAPK) cascade, relays signals for cell proliferation, and appears to be linked to carcinogenesis. The PP2A holoenzyme exists in several trimeric forms consisting of a 36- kD core catalytic subunit, PP2A- C; a 65- kD structural/regulatory component, PP2A- A; and a variable regulatory subunit, PP2A- B, which confers distinct properties on the holoenzyme. Each subunit exists as multiple isoforms encoded by different genes, so that there are many forms of the PP2A trimer, differing in expression pattern and specificity. The gene identified (Wang et al.,

1998) at 11q23, denoted PPP2R1B, encodes the beta- isoform of the structural- regulatory A subunit PP2A- A- beta. This subunit is necessary for interaction of the catalytic PP2A- C and variable PP2A- B subunits and is critical for phosphatase activity (Walter and Mumby, 1993). Wang et al. (1998) determined the precise physical location of PPP2R1B by colocalizing it within P1- derived artificial chromosome (PAC) clones that contained sequence tagged sites on 11q22- q23. They confirmed that the PPP2R1B gene is located in a region showing high frequency LOH. Sequencing of the PPP2R1B gene revealed somatic alterations in 15% (5 in 32) of primary lung tumors, 6% (4 in 70) of lung tumor- derived cell lines, and 15% (2 in 13) of primary colon tumors. One deletion mutation generated a truncated PP2A- A- beta protein that was unable to bind to the catalytic subunit of the PP2A holoenzyme. The PPP2R1B gene product may suppress tumor development through its role in cell cycle regulation and cellular growth control.

[15669]

[15670] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15671] Wang, S. S.; Esplin, E. D.; Li, J. L.; Huang, L.; Gazdar, A.; Minna, J.; Evans, G. A. : Alterations of the PPP2R1B gene in human lung and colon cancer. Science 282: 284- 287, 1998. ; and

[15672] Wang, S. S.; Esplin, E. D.; Li, J. L.; Huang, L.; Gazdar, A.; Minna, J.; Evans, G. A. : Alterations of the PPP2R1B gene in human lung and colon cancer. Science 282: 284- 287, 1998.

[15673] Further studies establishing the function and utilities of PPP2R1B are found in John Hopkins OMIM database record ID 603113, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein phosphatase 2 (formerly 2a), regulatory subunit b (pr 52), beta isoform (PPP2R2B, Accession NP_004567.1) is another GAM94 target gene, herein designated TARGET GENE. PPP2R2B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPP2R2B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP2R2B BINDING SITE, designated SEQ ID:15433, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15674] Another function of GAM94 is therefore inhibition of Protein phosphatase 2 (formerly 2a), regulatory subunit b (pr 52), beta isoform (PPP2R2B, Accession NP_004567.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R2B.

[15675] Pancreatic polypeptide 2 (PPY2, Accession NP_066578.1) is another GAM94 target gene, herein designated TARGET GENE. PPY2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPY2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPY2 BINDING SITE, designated SEQ ID:19063, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15676] Another function of GAM94 is therefore inhibition of Pancreatic polypeptide 2 (PPY2, Accession NP_066578.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPY2.

[15677] Preimplantation protein 3 (PREI3, Accession NP_056202.1) is another GAM94 target gene, herein designated TARGET

GENE. PREI3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PREI3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PREI3 BINDING SITE, designated SEQ ID:3082, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15678] Another function of GAM94 is therefore inhibition of Preimplantation protein 3 (PREI3, Accession NP_056202.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PREI3.

[15679] Protein kinase c binding protein 1 (PRKCBP1, Accession NP_036540.2) is another GAM94 target gene, herein designated TARGET GENE. PRKCBP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRKCBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKCBP1 BINDING SITE, designated SEQ ID:13695, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated

SEQ ID:332.

[15680] Another function of GAM94 is therefore inhibition of Protein kinase c binding protein 1 (PRKCBP1, Accession NP_036540.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCBP1.

[15681] PRO0327 (Accession NP_054844.1) is another GAM94 target gene, herein designated TARGET GENE. PRO0327 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO0327, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0327 BINDING SITE, designated SEQ ID:13463, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15682] Another function of GAM94 is therefore inhibition of PRO0327 (Accession NP_054844.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0327.

[15683] PRO0767 (Accession NP_054802.1) is another GAM94 target gene, herein designated TARGET GENE. PRO0767 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by PRO0767, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0767 BINDING SITE, designated SEQ ID:14093, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15684] Another function of GAM94 is therefore inhibition of PRO0767 (Accession NP_054802.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0767.

[15685] PRO0943 (Accession NP_061038.1) is another GAM94 target gene, herein designated TARGET GENE. PRO0943 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO0943, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0943 BINDING SITE, designated SEQ ID:17160, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15686] Another function of GAM94 is therefore inhibition of PRO0943 (Accession NP_061038.1) . Accordingly, utilities

of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0943.

[15687] PRO1787 (Accession NP_061076.1) is another GAM94 target gene, herein designated TARGET GENE. PRO1787 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO1787, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO1787 BINDING SITE, designated SEQ ID:16488, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15688] Another function of GAM94 is therefore inhibition of PRO1787 (Accession NP_061076.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1787.

[15689] Pregnancy specific beta-1-glycoprotein 1 (PSG1, Accession NP_008836.2) is another GAM94 target gene, herein designated TARGET GENE. PSG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PSG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of PSG1 BINDING SITE, designated SEQ ID:1739, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15690] Another function of GAM94 is therefore inhibition of Pregnancy specific beta-1-glycoprotein 1 (PSG1, Accession NP_008836.2), a gene which is a member of the pregnancy- specific glycoprotein (PSG) and CEA families. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSG1.

[15691] The function of PSG1 has been established by previous studies. The human placenta is a multihormonal endocrine organ which produces hormones, enzymes, and other molecules that support fetal survival and development. Chorionic gonadotropin (118850, 118860), placental lactogen (OMIM Ref. No. 150200), and placental alkaline phosphatase (OMIM Ref. No. 171800) are 3 of the best- known placental proteins. Immunochemical studies on the protein composition of the serum in human pregnancy revealed several so- called pregnancy- specific proteins, including pregnancy- specific beta- 1- glycoprotein (PSBG). PSBG becomes detectable in serum during the first 2 to 3 weeks of pregnancy and increases as preg-

nancy progresses, rising to a very high level of 200 to 400 micrograms per milliliter. Although its exact physiologic role during pregnancy is unknown, the high quantity produced by the placenta argues for its importance. PSBG isolated from human placenta consists of a set of at least 3 glycoproteins with apparent molecular masses of 72, 64, and 54 kD, respectively. The heterogeneity is confirmed by detection of 3 nonglycosylated polypeptides of 50, 48, and 36 kD, which can be immunoprecipitated by antiserum to placental PSBG obtained by in vitro translation of placental polyadenylated RNA. Watanabe and Chou (1988) examined the structural relationship of these proteins by the isolation and study of cDNA clones The members of the CEA/PSG gene family have a characteristic N-terminal domain that is homologous to the immunoglobulin variable region. Khan et al. (1992) estimated the size of the PSG subfamily by identification of N- domain exons from isolated genomic clones and from total genomic DNA through PCR amplification and DNA sequence determination. They found that the PSG subfamily contains at least 11 different genes. For 7 of these, 2 DNA sequences differing from each other in 1 to 4 nucleotides were detected. Most likely they represent different alleles. All of

the PSGs except PSG1, PSG4 (OMIM Ref. No. 176393), and PSG8 (OMIM Ref. No. 176397) contain the arginine- glycine- aspartic acid sequence at position 93- 95 corresponding to the complementarity determining region 3 of immunoglobulin. Parsimony analysis of 24 CEA and PSG sequences using 12 members of the immunoglobulin gene superfamily as out- groups to root the family tree showed that the N- domain of the CEA group genes evolved in one major branch and the PSG group genes in the other. Brandriff et al. (1992) estimated that the CEA-PSG gene family region spans 1.1 to 1.2 Mb. Using a high-resolution restriction fragment fingerprinting technique, Olsen et al. (1994) assembled 256 cosmids spanning the PSG region on 19q13.2 into a single 700- kb contig. FISH to sperm pronuclei and cosmid walking experiments indicated that this PSG contig is telomeric of CGM8 at the telomeric end of the CEA subgroup gene cluster. Detailed restriction mapping and hybridization with gene- specific probes indicated that the order of the 11 PSG genes in the contig is cen- - PSG3 (OMIM Ref. No. 176392)- - PSG8- - PSG12 (PSG10; 176399)- - PSG1- - PSG6 (OMIM Ref. No. 176395)- - PSG7 (OMIM Ref. No. 176396)- - PSG13 (PSG11; 176401)- - PSG2 (OMIM Ref. No. 176391)- -

PSG5 (OMIM Ref. No. 176394)- - PSG4- - PSG11 (PSG9; 176398)- - tel. The PSG genes are tandemly oriented in a 5- prime to 3- prime direction from telomere to centromere. The CEA subgroup gene CGM11 is located at the telomeric end of the PSG gene cluster, and 6 genes belonging to a third CEA family subgroup, namely CGM13 through CGM18 (later OMIM Ref. No. 109770), are interspersed among the PSG genes.

[15692]

[15693] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15694] Brandriff, B. F.; Gordon, L. A.; Tynan, K. T.; Olsen, A. S.; Mohrenweiser, H. W.; Fertitta, A.; Carrano, A. V.; Trask, B. J. : Order and genomic distances among members of the carcinoembryonic antigen (CEA) gene family determined by fluorescence in situ hybridization. Genomics 12: 773-779, 1992. ; and

[15695] Teglund, S.; Olsen, A.; Khan, W. N.; Frangsmyr, L.; Hammarstrom, S. : The pregnancy- specific glycoprotein (PSG) gene cluster on human chromosome 19: fine structure of the 11 PSG genes a.

[15696] Further studies establishing the function and utilities of

PSG1 are found in John Hopkins OMIM database record ID 176390, and in cited publications listed in Table 5, which are hereby incorporated by reference.PSPC1 (Accession NP_060752.1) is another GAM94 target gene, herein designated TARGET GENE. PSPC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PSPC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSPC1 BINDING SITE, designated SEQ ID:2242, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15697] Another function of GAM94 is therefore inhibition of PSPC1 (Accession NP_060752.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSPC1.

[15698] Prostaglandin f2 receptor negative regulator (PTGFRN, Accession XP_040709.3) is another GAM94 target gene, herein designated TARGET GENE. PTGFRN BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PTGFRN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of PTGFRN BINDING SITE, designated SEQ ID:992, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15699] Another function of GAM94 is therefore inhibition of Prostaglandin f2 receptor negative regulator (PTGFRN, Accession XP_040709.3), a gene which inhibits the binding of prostaglandin f2- alpha (pgf2- alpha) to its specific fp receptor. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGFRN.

[15700] The function of PTGFRN has been established by previous studies. Orlicky et al. (1996) isolated a protein that copurifies with bovine prostaglandin F- 2- alpha receptor (FP) and cloned the corresponding rat cDNA. Transfection experiments suggested that this protein inhibits binding of PGF- 2- alpha to FP. Histologically, this protein (called FP regulatory protein, or FPRP, by them) shows a distribution coinciding well with those cells and tissues that respond to PGF- 2- alpha.

[15704] Stipp et al. (2001) used moderately stringent Brij96/97 detergent extraction to show that FPRP associates specifically with CD81 and CD9 but not with other tetraspanin molecules, such as C.

[15705] Further studies establishing the function and utilities of PTGFRN are found in John Hopkins OMIM database record ID 601204, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ptk2 protein tyrosine kinase 2 (PTK2, Accession NP_005598.3) is another GAM94 target gene, herein designated TARGET GENE. PTK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTK2 BINDING SITE, designated SEQ ID:18787, to the nucleotide sequence of

GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15706] Another function of GAM94 is therefore inhibition of Ptk2 protein tyrosine kinase 2 (PTK2, Accession NP_005598.3), a gene which involves in intracellular signal transduction pathway and is a putative homolog of chicken focal adhesion associated kinase. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK2.

[15707] The function of PTK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM65.2.Ptk2 protein tyrosine kinase 2 (PTK2, Accession NP_722560.1) is another GAM94 target gene, herein designated TARGET GENE. PTK2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTK2 BINDING SITE, designated SEQ ID:18787, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15708] Another function of GAM94 is therefore inhibition of Ptk2 protein tyrosine kinase 2 (PTK2, Accession NP_722560.1), a gene which involves in intracellular signal transduction pathway and is a putative homolog of chicken focal adhesion associated kinase. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK2.

[15709] The function of PTK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM65.2.Protein tyrosine phosphatase, non-receptor type 4 (megakaryocyte) (PTPN4, Accession NP_002821.1) is another GAM94 target gene, herein designated TARGET GENE. PTPN4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PTPN4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPN4 BINDING SITE, designated SEQ ID:6994, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15710] Another function of GAM94 is therefore inhibition of Protein tyrosine phosphatase, non-receptor type 4

(megakaryocyte) (PTPN4, Accession NP_002821.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN4.

[15711] Protein tyrosine phosphatase, non-receptor type 6 (PTPN6, Accession NP_536859.1) is another GAM94 target gene, herein designated TARGET GENE. PTPN6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTPN6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPN6 BINDING SITE, designated SEQ ID:5903, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15712] Another function of GAM94 is therefore inhibition of Protein tyrosine phosphatase, non-receptor type 6 (PTPN6, Accession NP_536859.1), a gene which plays a key role in hematopoiesis and therefore may be associated with Leukemia. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Leukemia, and of other diseases and clinical conditions associated with PTPN6.

[15713] The function of PTPN6 has been established by previous

studies. The growth and functional responses of hematopoietic cells are regulated through tyrosine phosphorylation of proteins. Using a PCR approach, Yi et al. (1991) identified 3 novel tyrosine protein phosphatases in hematopoietic cells. One of these, expressed predominantly in hematopoietic cells, was termed hematopoietic cell phosphatase (HCPH). From a pre- B- cell- derived library, Matthews et al. (1992) cloned the mouse PTPN6 cDNA, which they designated SHP (Src homology region 2-domain phosphatase). Yi et al. (1992) obtained complete cDNAs for both the human and the murine HCPH and mapped the gene in the human to 12p13- p12 by fluorescence in situ hybridization. The human gene was also cloned from a breast cancer cell line and was termed PTP1C by Shen et al. (1991). This is a cytoplasmic protein that contains a phosphatase- catalytic domain in the carboxyl terminal region and 2 tandemly repeated, src- homology 2 (SH2) domains in the amino terminal region. SH2 domains were first identified in the SRC gene family and found in a variety of proteins involved in signal transduction. The SH2 domains may recognize phosphorylated tyrosine residues and direct protein- protein associations. By study of panels of somatic cell hybrids and fluores-

cence in situ hybridization, Plutzky et al. (1992) determined that the gene encoding the nontransmembrane protein- tyrosine phosphatase of the nonreceptor type 6 is located in region 12p13. Plutzky et al. (1992) suggested that since PTPN6 is expressed at high levels in hematopoietic cells of all lineages and its expression is induced early in hematopoietic differentiation, and since 12p13 is a region commonly involved in leukemia- associated chromosomal abnormalities, altered expression and/or structure of PTPN6 may play a role in leukemogenesis. Using a genomic probe in interspecific backcross analysis, Yi et al. (1992) mapped the murine Hcph gene to chromosome 6 where it was found to be tightly linked to the Tnfr- 2 and Ly- 4 genes. Mice with the recessive 'moth eaten' (me) or the allelic 'viable moth eaten' mutations express a severe autoimmune and immunodeficiency syndrome. Tsui et al. (1993) showed that the basic defect involves lesions in the gene that encodes hematopoietic cell phosphatase. Shultz et al. (1993) showed that 2 allelic 'motheaten' mutations result in aberrant splicing of the Hcph transcript. Thus, 'motheaten' was the first animal model for a specific protein- tyrosine phosphatase deficiency, useful in determining the precise role of HCPH in

hematopoiesis. Banville et al. (1995) demonstrated that the PTPN6 gene consists of 17 exons spanning 17 kb of DNA. Three nonhematopoietic PTPN6 transcripts were identified in a variety of cell lines and were shown to be transcribed from a common promoter. The hematopoietic form of the PTPN6 transcript is initiated at a downstream promoter separated by 7 kb from the upstream promoter. This downstream promoter is active exclusively in cells of the hematopoietic lineage.

[15714]

[15718] Further studies establishing the function and utilities of PTPN6 are found in John Hopkins OMIM database record

ID 176883, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pumilio homolog 2 (drosophila) (PUM2, Accession NP_056132.1) is another GAM94 target gene, herein designated TARGET GENE. PUM2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PUM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PUM2 BINDING SITE, designated SEQ ID:2095, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15719] Another function of GAM94 is therefore inhibition of Pumilio homolog 2 (drosophila) (PUM2, Accession NP_056132.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PUM2.

[15720] Pwp2 periodic tryptophan protein homolog (yeast) (PWP2H, Accession NP_005040.1) is another GAM94 target gene, herein designated TARGET GENE. PWP2H BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PWP2H, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PWP2H BINDING SITE, designated SEQ ID:17316, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15721] Another function of GAM94 is therefore inhibition of Pwp2 periodic tryptophan protein homolog (yeast) (PWP2H, Accession NP_005040.1), a gene which is a member of the beta transducin protein superfamily and therefore may be associated with Holoprosencephaly- 1 (hpe1). Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Holoprosencephaly- 1 (hpe1), and of other diseases and clinical conditions associated with PWP2H.

[15722] The function of PWP2H has been established by previous studies. As part of a study to identify genes that might be implicated in Down syndrome, Lalioti et al. (1996) used exon trapping from cosmids that had been mapped to 21q22.3. An exon was isolated that encoded a predicted protein which was similar to the yeast PWP2 gene, a member of the tryptophan- aspartate (WD) repeat- containing superfamily. PWP2 is essential for viability and may play a role in the early G1 phase of the cell cycle. The complete coding region of human PWP2, obtained from fetal brain

and fetal kidney cDNA libraries, encodes a 919- amino acid predicted protein with over 40% identity to the yeast protein. It also shares similarity to the beta subunits of the trimeric G- protein family (e.g., 139380). The protein contains 5 complete WD repeats and an acidic domain between the second and third WD motifs. Northern blots showed a 3.4- kb PWP2 mRNA in all fetal and adult tissues examined. Based on cosmid contig analysis, the gene was mapped approximately 200 kb proximal to PFKL (OMIM Ref. No. 171860). To identify candidate genes for diseases mapping to 21q22.3, Lafreniere et al. (1996) assembled a 770- kb cosmid and a BAC contig containing 8 tightly linked markers. They then restriction mapped these cosmids and BACs using 8 rare cutting enzymes, with the goal of identifying CpG- rich islands. A homology search using the sequence from one such island identified an expressed sequence tag (EST) with homology to PWP2 of yeast. Northern blot analysis revealed a 3.3- kb transcript that was highly expressed in all tissues tested. A 3,157-bp cDNA contained an open reading frame potentially encoding 919 amino acid residues. The predicted protein shows 42% identity and 57% similarity at the amino acid level to the yeast PWP2 protein. The PWP gene is split into

21 exons, ranging in size from 53 to 516 bp, and spans an estimated 25 kb. The gene is transcribed in a 21cen- to- 21qter direction, with its 5- prime end mapping approximately 195 kb proximal to the 5- prime end of the PFKL gene. Lafreniere et al. (1996) suggested that this gene is a candidate for the site of the mutation causing holoprosencephaly- 1 (HPE1; 236100).

[15723]

[15727] Further studies establishing the function and utilities of PWP2H are found in John Hopkins OMIM database record

ID 601475, and in cited publications listed in Table 5, which are hereby incorporated by reference.QKI (Accession XP_037438.4) is another GAM94 target gene, herein designated TARGET GENE. QKI BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by QKI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of QKI BINDING SITE, designated SEQ ID:15541, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15728] Another function of GAM94 is therefore inhibition of QKI (Accession XP_037438.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with QKI.

[15729] Rab11-FIP3 (Accession NP_055515.1) is another GAM94 target gene, herein designated TARGET GENE. Rab11-FIP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by Rab11-FIP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of Rab11-FIP3 BINDING SITE, designated SEQ ID:5368, to the

nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15730] Another function of GAM94 is therefore inhibition of Rab11-FIP3 (Accession NP_055515.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP3.

[15731] Rab13, member ras oncogene family (RAB13, Accession NP_002861.1) is another GAM94 target gene, herein designated TARGET GENE. RAB13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB13 BINDING SITE, designated SEQ ID:19823, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15732] Another function of GAM94 is therefore inhibition of Rab13, member ras oncogene family (RAB13, Accession NP_002861.1), a gene which is a member of the RAB family of small GTPases. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB13.

[15733] The function of RAB13 has been established by previous studies. The Rab proteins comprise the largest group of Ras- associated small GTPases and in mammalian cells at least 40 proteins have been identified (Novick and Zerial, 1997). Rab proteins are specific regulators of vesicular traffic and the complexity of the Rab protein family correlates with the diversity of cellular vesicle transport routes. A different Rab protein may be required for each step of vesicular transport. For example, the yeast Sec4 protein appears to be required exclusively for the delivery of Golgi- derived secretory vesicles to the plasma membrane (Salminen and Novick, 1987). By screening a human intestinal epithelial cell (OMIM Ref. No. Caco- 2) cDNA library with a degenerate oligonucleotide based on a sequence present in the effector domain of the Sec4 protein, Zahraoui et al. (1994) isolated a cDNA encoding RAB13. The predicted 203- amino acid protein has the typical structural features of Ras- related proteins, including a conserved GTP- binding site. RAB13 displays 61% and 56% amino acid identity with the human RAB8 (OMIM Ref. No. 165040) and yeast Sec4 proteins, respectively. These proteins share a long conserved N- terminal region but have divergent C- terminal portions. Northern blot analysis

showed that RAB13 is expressed as a 1.2- kb transcript in Caco- 2 cells. Immunoblot analysis using antibodies against RAB13 detected a 24- kD protein in Caco- 2 cell lysates. Immunofluorescence studies demonstrated that RAB13 colocalizes with the tight junction marker ZO1 (TJP1; 601009) in epithelial cells. In cells devoid of tight junctions, RAB13 associates with vesicles dispersed throughout the cytoplasm. Leek et al. (1997) mapped the RAB13 gene to 12q13 by in situ hybridization.

[15734]

[15735] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15736] Leek, J. P.; Hamlin, P. J.; Wilton, J.; Lench, N. J. : Assignment of the Rab13 gene (RAB13) to human chromosome band 12q13 by in situ hybridization. Cytogenet. Cell Genet. 79: 210- 211, 1997. ; and

[15737] Novick, P.; Zerial, M. : The diversity of Rab proteins in vesicle transport. Curr. Opin. Cell Biol. 9: 496- 504, 1997.

[15738] Further studies establishing the function and utilities of RAB13 are found in John Hopkins OMIM database record ID 602672, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rab17, mem-

ber ras oncogene family (RAB17, Accession NP_071894.1) is another GAM94 target gene, herein designated TARGET GENE. RAB17 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RAB17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB17 BINDING SITE, designated SEQ ID:18736, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15739] Another function of GAM94 is therefore inhibition of Rab17, member ras oncogene family (RAB17, Accession NP_071894.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB17.

[15740] Rab5a, member ras oncogene family (RAB5A, Accession NP_004153.2) is another GAM94 target gene, herein designated TARGET GENE. RAB5A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RAB5A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB5A BINDING SITE, designated

SEQ ID:18284, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15741] Another function of GAM94 is therefore inhibition of Rab5a, member ras oncogene family (RAB5A, Accession NP_004153.2), a gene which is a rate- limiting component of the machinery regulating the kinetics of membrane traffic. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB5A.

[15742] The function of RAB5A has been established by previous studies. The S. cerevisiae YPT1 and SEC4 genes encode Ras- related GTP- binding proteins involved in the regulation of secretion. Mammalian cells express a large number of RAB proteins, GTP- binding proteins closely related to YPT1 and SEC4. By screening a human pheochromocytoma library with probes derived from the SEC4 gene and from various rat and human RAB cDNAs, Zahraoui et al. (1989) isolated cDNAs encoding RAB1 (OMIM Ref. No. 179508), RAB2 (OMIM Ref. No. 179509), RAB3A (OMIM Ref. No. 179490), RAB3B (OMIM Ref. No. 179510), RAB4 (OMIM Ref. No. 179511), RAB5, and RAB6 (OMIM Ref. No. 179513). Except for the closely related RAB3A and RAB3B, the deduced human RAB proteins share 32 to 50% homol-

ogy. The predicted 214- amino acid RAB5 protein is 31% and 38% identical to SEC4 and YPT1, respectively. All 6 human RAB proteins tested bound GTP and exhibited GTPase activities in vitro. Northern blot analysis revealed that RAB5 was expressed as 2.7- and 2.8- kb mRNAs in a human fibroblast cell line. Bucci et al. (1992) demonstrated that RAB5 is a rate- limiting component of the machinery regulating the kinetics of membrane traffic in the early endocytic pathway. Stenmark et al. (1995) reported that rabaptin- 5 (OMIM Ref. No. 603616) is an effector of RAB5 that transmits the signal of the active GTP- bound RAB5 conformation to the membrane docking and/or fusion apparatus. Xiao et al. (1997) found that tuberin (OMIM Ref. No. 191092) exhibits substantial GTPase- activating protein (GAP) activity towards RAB5, and that rabaptin- 5 mediates the tuberin association with RAB5. The authors suggested that tuberin functions as a RAB5GAP in vivo to negatively regulate RAB5- GTP activity in endocytosis.

[15743]

[15744] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

mons, K.; Hoflack, B.; Zerial, M. : The small GTPase rab5 functions as a regulatory factor in the early endocytic pathway. Cell 70: 715- 728, 1992. ; and

[15746] Xiao, G.- H.; Shoarinejad, F.; Jin, F.; Golemis, E. A.; Yeung, R. S. : The tuberous sclerosis 2 gene product, tuberin, functions as a Rab5 GTPase activating protein (GAP) in modulating en.

[15747] Further studies establishing the function and utilities of RAB5A are found in John Hopkins OMIM database record ID 179512, and in cited publications listed in Table 5, which are hereby incorporated by reference.RAD54B (Accession NP_602310.1) is another GAM94 target gene, herein designated TARGET GENE. RAD54B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RAD54B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAD54B BINDING SITE, designated SEQ ID:8649, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15748] Another function of GAM94 is therefore inhibition of RAD54B (Accession NP_602310.1), a gene which is in-

volved in dna repair and mitotic recombination and therefore may be associated with Lymphoma and colon cancer. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Lymphoma and colon cancer, and of other diseases and clinical conditions associated with RAD54B.

[15749] The function of RAD54B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.2.RAGB (Accession NP_057740.1) is another GAM94 target gene, herein designated TARGET GENE. RAGB BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by RAGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAGB BINDING SITE, designated SEQ ID:16756, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15750] Another function of GAM94 is therefore inhibition of RAGB (Accession NP_057740.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAGB.

[15751] RAGB (Accession NP_006055.2) is another GAM94 target gene, herein designated TARGET GENE. RAGB BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by RAGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAGB BINDING SITE, designated SEQ ID:16756, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15752] Another function of GAM94 is therefore inhibition of RAGB (Accession NP_006055.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAGB.

[15753] Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NP_739579.1) is another GAM94 target gene, herein designated TARGET GENE. RASSF2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by RASSF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:16451, to the

nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15754] Another function of GAM94 is therefore inhibition of Ras association (ralgds/af-6) domain family 2 (RASSF2, Accession NP_739579.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2.

[15755] Retinoblastoma-like 1 (p107) (RBL1, Accession NP_002886.1) is another GAM94 target gene, herein designated TARGET GENE. RBL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RBL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBL1 BINDING SITE, designated SEQ ID:15482, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15756] Another function of GAM94 is therefore inhibition of Retinoblastoma-like 1 (p107) (RBL1, Accession NP_002886.1), a gene which has an important role in negatively regulating the rate of progression of the cell cycle. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with RBL1.

[15757] The function of RBL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Rna binding motif protein 9 (RBM9, Accession NP_055124.1) is another GAM94 target gene, herein designated TARGET GENE. RBM9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RBM9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBM9 BINDING SITE, designated SEQ ID:13123, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15758] Another function of GAM94 is therefore inhibition of Rna binding motif protein 9 (RBM9, Accession NP_055124.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM9.

[15759] RIL (Accession NP_003678.2) is another GAM94 target gene, herein designated TARGET GENE. RIL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RIL, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RIL BINDING SITE, designated SEQ ID:16498, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15760] Another function of GAM94 is therefore inhibition of RIL (Accession NP_003678.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIL.

[15761] Rar-related orphan receptor a (RORA, Accession NP_002934.1) is another GAM94 target gene, herein designated TARGET GENE. RORA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RORA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RORA BINDING SITE, designated SEQ ID:6954, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15762] Another function of GAM94 is therefore inhibition of Rar-related orphan receptor a (RORA, Accession

NP_002934.1), a gene which binds dna as a monomer to hormone response elements (hre) containing a single core motif half- site preceded by a short a- t rich sequences. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RORA.

[15763] The function of RORA has been established by previous studies. Meyer et al. (2000) showed that the RORA gene and the RORC (OMIM Ref. No. 602943) gene, but not the RORB gene, are expressed in mesenchymal stem cells derived from bone marrow. Cells undergoing osteogenic differentiation showed increased messenger signal expression. They found that homozygous 'staggerer' mutants have thin long bones compared with heterozygous animals and wildtype littermates and that the bones of sg/sg animals are osteopenic. They concluded that the product of the Rora gene most likely acts by direct modulation of a bone matrix component

[15764] Animal model experiments lend further support to the function of RORA. The recessive mouse mutation 'staggerer' (sg) is associated with severe cerebellar ataxia due to a cell- autonomous defect in the development of Purkinje cells. These cells are reduced in numbers and show

immature morphology, synaptic arrangement, biochemical properties, and gene expression. In addition, sg heterozygotes show accelerated dendritic atrophy and cell loss, suggesting that sg has a role in mature Purkinje cells. Certain functions of the immune system are also affected. Hamilton et al. (1996) mapped sg to a 160- kb interval on mouse chromosome 9 that was found to contain the gene encoding Rora, a member of the nuclear hormone receptor superfamily. Furthermore, sg mice were found to carry a deletion within the Rora gene that prevents translation of the ligand- binding homology domain. Based on these results, they proposed a model in which Rora interacts with the thyroid hormone signaling pathway to induce Purkinje cell maturation. Of the 4 different isoforms of the Rora gene that are generated by a combination of alternative promoter usage and exon splicing and that differ in their DNA- binding properties, Matysiak- Scholze and Nehls (1997) found that isoforms Rora1 and Rora4 are specifically coexpressed in the murine cerebellum and human cerebellum. Thus, at least 2 isoforms of the murine Rora gene are affected by the genomic deletion associated with the sg phenotype. The finding of cerebellum- specific coregulation of Rora1 and Rora4 suggested that distinct

sets of target genes regulated by the Rora1 and Rora4 isoforms are required for Purkinje cell development

[15765] It is appreciated that the abovementioned animal model for RORA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[15766] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15767] Meyer, T.; Kneissel, M.; Mariani, J.; Fournier, B. : In vitro and in vivo evidence for orphan nuclear receptor ROR- alpha function in bone metabolism. Proc. Nat. Acad. Sci. 97: 9197- 9202, 2000. ; and

[15768] Matysiak- Scholze, U.; Nehls, M. : The structural integrity of ROR- alpha isoforms is mutated in staggerer mice: cerebellar coexpression of ROR- alpha- 1 and ROR- alpha- 4. Genomics 43: 78- 84, 1.

[15769] Further studies establishing the function and utilities of RORA are found in John Hopkins OMIM database record ID 600825, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rar-related orphan receptor a (RORA, Accession NP_599023.1) is another GAM94 target gene, herein designated TARGET GENE.

RORA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RORA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RORA BINDING SITE, designated SEQ ID:6954, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15770] Another function of GAM94 is therefore inhibition of Rar-related orphan receptor a (RORA, Accession NP_599023.1), a gene which binds dna as a monomer to hormone response elements (hre) containing a single core motif half- site preceded by a short a- t rich sequences. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RORA.

[15771] The function of RORA has been established by previous studies. Meyer et al. (2000) showed that the RORA gene and the RORC (OMIM Ref. No. 602943) gene, but not the RORB gene, are expressed in mesenchymal stem cells derived from bone marrow. Cells undergoing osteogenic differentiation showed increased messenger signal expression. They found that homozygous 'staggerer' mutants

have thin long bones compared with heterozygous animals and wildtype littermates and that the bones of sg/sg animals are osteopenic. They concluded that the product of the Rora gene most likely acts by direct modulation of a bone matrix component

[15772] Animal model experiments lend further support to the function of RORA. The recessive mouse mutation 'staggerer' (sg) is associated with severe cerebellar ataxia due to a cell- autonomous defect in the development of Purkinje cells. These cells are reduced in numbers and show immature morphology, synaptic arrangement, biochemical properties, and gene expression. In addition, sg heterozygotes show accelerated dendritic atrophy and cell loss, suggesting that sg has a role in mature Purkinje cells. Certain functions of the immune system are also affected. Hamilton et al. (1996) mapped sg to a 160- kb interval on mouse chromosome 9 that was found to contain the gene encoding Rora, a member of the nuclear hormone receptor superfamily. Furthermore, sg mice were found to carry a deletion within the Rora gene that prevents translation of the ligand- binding homology domain. Based on these results, they proposed a model in which Rora interacts with the thyroid hormone signaling pathway to induce

Purkinje cell maturation. Of the 4 different isoforms of the Rora gene that are generated by a combination of alternative promoter usage and exon splicing and that differ in their DNA- binding properties, Matysiak- Scholze and Nehls (1997) found that isoforms Rora1 and Rora4 are specifically coexpressed in the murine cerebellum and human cerebellum. Thus, at least 2 isoforms of the murine Rora gene are affected by the genomic deletion associated with the sg phenotype. The finding of cerebellum- specific coregulation of Rora1 and Rora4 suggested that distinct sets of target genes regulated by the Rora1 and Rora4 isoforms are required for Purkinje cell development

[15773] It is appreciated that the abovementioned animal model for RORA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[15774] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15775] Meyer, T.; Kneissel, M.; Mariani, J.; Fournier, B. : In vitro and in vivo evidence for orphan nuclear receptor ROR- alpha function in bone metabolism. Proc. Nat. Acad. Sci. 97: 9197- 9202, 2000. ; and

[15776] Matysiak- Scholze, U.; Nehls, M. : The structural integrity of ROR- alpha isoforms is mutated in staggerer mice: cerebellar coexpression of ROR- alpha- 1 and ROR- alpha- 4. Genomics 43: 78- 84, 1.

[15777] Further studies establishing the function and utilities of RORA are found in John Hopkins OMIM database record ID 600825, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rar-related orphan receptor a (RORA, Accession NP_599024.1) is another GAM94 target gene, herein designated TARGET GENE. RORA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RORA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RORA BINDING SITE, designated SEQ ID:6954, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15778] Another function of GAM94 is therefore inhibition of Rar-related orphan receptor a (RORA, Accession NP_599024.1), a gene which binds dna as a monomer to hormone response elements (hre) containing a single core motif half- site preceded by a short a- t rich sequences.

Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RORA.

[15779] The function of RORA has been established by previous studies. Meyer et al. (2000) showed that the RORA gene and the RORC (OMIM Ref. No. 602943) gene, but not the RORB gene, are expressed in mesenchymal stem cells derived from bone marrow. Cells undergoing osteogenic differentiation showed increased messenger signal expression. They found that homozygous 'staggerer' mutants have thin long bones compared with heterozygous animals and wildtype littermates and that the bones of sg/sg animals are osteopenic. They concluded that the product of the Rora gene most likely acts by direct modulation of a bone matrix component

[15780] Animal model experiments lend further support to the function of RORA. The recessive mouse mutation 'staggerer' (sg) is associated with severe cerebellar ataxia due to a cell- autonomous defect in the development of Purkinje cells. These cells are reduced in numbers and show immature morphology, synaptic arrangement, biochemical properties, and gene expression. In addition, sg heterozygotes show accelerated dendritic atrophy and cell loss,

suggesting that sg has a role in mature Purkinje cells. Certain functions of the immune system are also affected. Hamilton et al. (1996) mapped sg to a 160- kb interval on mouse chromosome 9 that was found to contain the gene encoding Rora, a member of the nuclear hormone receptor superfamily. Furthermore, sg mice were found to carry a deletion within the Rora gene that prevents translation of the ligand- binding homology domain. Based on these results, they proposed a model in which Rora interacts with the thyroid hormone signaling pathway to induce Purkinje cell maturation. Of the 4 different isoforms of the Rora gene that are generated by a combination of alternative promoter usage and exon splicing and that differ in their DNA- binding properties, Matysiak- Scholze and Nehls (1997) found that isoforms Rora1 and Rora4 are specifically coexpressed in the murine cerebellum and human cerebellum. Thus, at least 2 isoforms of the murine Rora gene are affected by the genomic deletion associated with the sg phenotype. The finding of cerebellum- specific coregulation of Rora1 and Rora4 suggested that distinct sets of target genes regulated by the Rora1 and Rora4 isoforms are required for Purkinje cell development

[15781] It is appreciated that the abovementioned animal model

for RORA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[15782] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15783] Meyer, T.; Kneissel, M.; Mariani, J.; Fournier, B. : In vitro and in vivo evidence for orphan nuclear receptor ROR- alpha function in bone metabolism. Proc. Nat. Acad. Sci. 97: 9197- 9202, 2000. ; and

[15784] Matysiak- Scholze, U.; Nehls, M. : The structural integrity of ROR- alpha isoforms is mutated in staggerer mice: cerebellar coexpression of ROR- alpha- 1 and ROR- alpha- 4. Genomics 43: 78- 84, 1.

[15785] Further studies establishing the function and utilities of RORA are found in John Hopkins OMIM database record ID 600825, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rar-related orphan receptor a (RORA, Accession NP_599022.1) is another GAM94 target gene, herein designated TARGET GENE. RORA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RORA, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RORA BINDING SITE, designated SEQ ID:6954, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15786] Another function of GAM94 is therefore inhibition of Rar-related orphan receptor a (RORA, Accession NP_599022.1), a gene which binds dna as a monomer to hormone response elements (hre) containing a single core motif half- site preceded by a short a- t rich sequences. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RORA.

[15787] The function of RORA has been established by previous studies. Meyer et al. (2000) showed that the RORA gene and the RORC (OMIM Ref. No. 602943) gene, but not the RORB gene, are expressed in mesenchymal stem cells derived from bone marrow. Cells undergoing osteogenic differentiation showed increased messenger signal expression. They found that homozygous 'staggerer' mutants have thin long bones compared with heterozygous animals and wildtype littermates and that the bones of sg/sg animals are osteopenic. They concluded that the product

of the Rora gene most likely acts by direct modulation of a bone matrix component

[15788] Animal model experiments lend further support to the function of RORA. The recessive mouse mutation 'staggerer' (sg) is associated with severe cerebellar ataxia due to a cell- autonomous defect in the development of Purkinje cells. These cells are reduced in numbers and show immature morphology, synaptic arrangement, biochemical properties, and gene expression. In addition, sg heterozygotes show accelerated dendritic atrophy and cell loss, suggesting that sg has a role in mature Purkinje cells. Certain functions of the immune system are also affected. Hamilton et al. (1996) mapped sg to a 160- kb interval on mouse chromosome 9 that was found to contain the gene encoding Rora, a member of the nuclear hormone receptor superfamily. Furthermore, sg mice were found to carry a deletion within the Rora gene that prevents translation of the ligand- binding homology domain. Based on these results, they proposed a model in which Rora interacts with the thyroid hormone signaling pathway to induce Purkinje cell maturation. Of the 4 different isoforms of the Rora gene that are generated by a combination of alternative promoter usage and exon splicing and that differ in

their DNA- binding properties, Matysiak- Scholze and Nehls (1997) found that isoforms Rora1 and Rora4 are specifically coexpressed in the murine cerebellum and human cerebellum. Thus, at least 2 isoforms of the murine Rora gene are affected by the genomic deletion associated with the sg phenotype. The finding of cerebellum- specific coregulation of Rora1 and Rora4 suggested that distinct sets of target genes regulated by the Rora1 and Rora4 isoforms are required for Purkinje cell development

[15789] It is appreciated that the abovementioned animal model for RORA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[15790] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15791] Meyer, T.; Kneissel, M.; Mariani, J.; Fournier, B. : In vitro and in vivo evidence for orphan nuclear receptor ROR- alpha function in bone metabolism. Proc. Nat. Acad. Sci. 97: 9197- 9202, 2000. ; and

[15792] Matysiak- Scholze, U.; Nehls, M. : The structural integrity of ROR- alpha isoforms is mutated in staggerer mice: cerebellar coexpression of ROR- alpha- 1 and ROR- al-

pha- 4. Genomics 43: 78- 84, 1.

[15793] Further studies establishing the function and utilities of RORA are found in John Hopkins OMIM database record ID 600825, and in cited publications listed in Table 5, which are hereby incorporated by reference.Replication protein a2, 32kda (RPA2, Accession NP_002937.1) is another GAM94 target gene, herein designated TARGET GENE. RPA2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RPA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPA2 BINDING SITE, designated SEQ ID:595, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15794] Another function of GAM94 is therefore inhibition of Replication protein a2, 32kda (RPA2, Accession NP_002937.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPA2.

[15795] Ribosomal protein l22 (RPL22, Accession NP_000974.1) is another GAM94 target gene, herein designated TARGET GENE. RPL22 BINDING SITE is a target binding site found in

the 3` untranslated region of mRNA encoded by RPL22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPL22 BINDING SITE, designated SEQ ID:16388, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15796] Another function of GAM94 is therefore inhibition of Ribosomal protein l22 (RPL22, Accession NP_000974.1), a gene which is a component of the large 60s ribosomal subunit ;binds herparin. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL22.

[15797] The function of RPL22 has been established by previous studies. A reciprocal translocation between the long arms of chromosomes 3 and 21, at bands 3q26 and 21q22, occurs as an acquired clonal chromosomal abnormality in malignant cells from patients with therapy- related myelodysplastic syndrome or acute myeloid leukemia, as well as in some patients with chronic myeloid leukemia in blast crisis. Nucifora et al. (1993) showed that the gene on chromosome 21 is AML1 (OMIM Ref. No. 151385), which is fused to the ETO gene (OMIM Ref. No. 133435) in 8;21

translocations. Nucifora et al. (1993) isolated a fusion cDNA clone from a t(3;21) library derived from a patient with therapy- related myelodysplastic syndrome; this clone contained sequences from AML1 and from EAP, which they localized to 3q26 from the location of the breakpoint on chromosome 3. EAP is a highly expressed small nuclear protein of 128 residues associated with Epstein- Barr virus small RNA. The fusion clone contained the DNA- binding 5- prime part of AML1 that is fused to ETO in the t(8;21) and, in addition, at least 1 other exon. The translocation replaced the last 9 codons of AML1 with the last 96 codons of EAP. The fusion does not maintain the correct reading frame of EAP and may not lead to a functional chimeric protein. EAP has been identified as the ribosomal protein L22 Nucifora and Rowley (1995) reviewed the involvement of the AML1 gene in the 8;21 and 3;21 translocations in acute and chronic myeloid leukemia. Three loci closely situated to each other on 3q26 are involved in fusions with AML1 in the 3;21 translocations: EVI1 (OMIM Ref. No. 165215), EAP, and MDS1 (OMIM Ref. No. 600049). They pointed out that the order of the genes on 3q26 is TEL- - EAP- - MDS1- - EVI1 and provided a diagram (their Figure 5) of the 3q26

region containing these genes and of the various chimeric junctions they had isolated from t(3;21) patients

[15798]

[15799] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15800] Nucifora, G.; Begy, C. R.; Erickson, R.; Drabkin, H. A.; Rowley, J. D. : The 3;21 translocation in myelodysplasia results in a fusion transcript between the AML1 gene and the gene for EAP, a highly conserved protein associated with the Epstein- Barr virus small RNA EBER 1. Proc. Nat. Acad. Sci. 90: 7784- 7788, 1993. ; and

[15801] Nucifora, G.; Rowley, J. D. : AML1 and the 8;21 and 3;21 translocations in acute and chronic myeloid leukemia. Blood 86: 1- 14, 1995.

[15802] Further studies establishing the function and utilities of RPL22 are found in John Hopkins OMIM database record ID 180474, and in cited publications listed in Table 5, which are hereby incorporated by reference.RRS1 (Accession NP_055984.1) is another GAM94 target gene, herein designated TARGET GENE. RRS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RRS1, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RRS1 BINDING SITE, designated SEQ ID:15022, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15803] Another function of GAM94 is therefore inhibition of RRS1 (Accession NP_055984.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRS1.

[15804] Spinocerebellar ataxia 1 (olivopontocerebellar ataxia 1, autosomal dominant, ataxin 1) (SCA1, Accession NP_000323.1) is another GAM94 target gene, herein designated TARGET GENE. SCA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCA1 BINDING SITE, designated SEQ ID:19326, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15805] Another function of GAM94 is therefore inhibition of Spinocerebellar ataxia 1 (olivopontocerebellar ataxia 1,

autosomal dominant, ataxin 1) (SCA1, Accession NP_000323.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCA1.

[15806] SCAMP5 (Accession NP_620417.1) is another GAM94 target gene, herein designated TARGET GENE. SCAMP5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCAMP5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCAMP5 BINDING SITE, designated SEQ ID:12952, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15807] Another function of GAM94 is therefore inhibition of SCAMP5 (Accession NP_620417.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAMP5.

[15808] Sodium channel, voltage-gated, type iv, beta polypeptide (SCN4B, Accession NP_777594.1) is another GAM94 target gene, herein designated TARGET GENE. SCN4B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCN4B, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCN4B BINDING SITE, designated SEQ ID:2309, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15809] Another function of GAM94 is therefore inhibition of Sodium channel, voltage-gated, type iv, beta polypeptide (SCN4B, Accession NP_777594.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN4B.

[15810] Sema domain, immunoglobulin domain (ig), short basic domain, secreted, (semaphorin) 3e (SEMA3E, Accession NP_036563.1) is another GAM94 target gene, herein designated TARGET GENE. SEMA3E BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEMA3E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:10055, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15811] Another function of GAM94 is therefore inhibition of Sema domain, immunoglobulin domain (ig), short basic domain, secreted, (semaphorin) 3e (SEMA3E, Accession NP_036563.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E.

[15812] Serine (or cysteine) proteinase inhibitor, clade b (ovalbumin), member 9 (SERPINB9, Accession NP_004146.1) is another GAM94 target gene, herein designated TARGET GENE. SERPINB9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SERPINB9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE, designated SEQ ID:8680, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15813] Another function of GAM94 is therefore inhibition of Serine (or cysteine) proteinase inhibitor, clade b (ovalbumin), member 9 (SERPINB9, Accession NP_004146.1), a gene which may be a serpin serine protease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of

GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB9.

[15814] The function of SERPINB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM88.2.SFMBT (Accession NP_057413.1) is another GAM94 target gene, herein designated TARGET GENE. SFMBT BINDING SITE1 and SFMBT BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SFMBT, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFMBT BINDING SITE1 and SFMBT BINDING SITE2, designated SEQ ID:17462 and SEQ ID:2582 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15815] Another function of GAM94 is therefore inhibition of SFMBT (Accession NP_057413.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFMBT.

[15816] Secreted frizzled-related protein 4 (SFRP4, Accession NP_003005.1) is another GAM94 target gene, herein designated TARGET GENE. SFRP4 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by SFRP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFRP4 BINDING SITE, designated SEQ ID:2316, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15817] Another function of GAM94 is therefore inhibition of Secreted frizzled-related protein 4 (SFRP4, Accession NP_003005.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP4.

[15818] Splicing factor, arginine/serine-rich 8 (suppressor-of-white-apricot homolog, drosophila) (SFRS8, Accession NP_689421.1) is another GAM94 target gene, herein designated TARGET GENE. SFRS8 BINDING SITE1 and SFRS8 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by SFRS8, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFRS8 BINDING SITE1 and SFRS8 BINDING SITE2, designated SEQ ID:1589 and SEQ

ID:3151 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15819] Another function of GAM94 is therefore inhibition of Splicing factor, arginine/serine-rich 8 (suppressor-of-white-apricot homolog, drosophila) (SFRS8, Accession NP_689421.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS8.

[15820] Sh3 domain binding glutamic acid-rich protein like 2 (SH3BGRL2, Accession NP_113657.1) is another GAM94 target gene, herein designated TARGET GENE. SH3BGRL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SH3BGRL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SH3BGRL2 BINDING SITE, designated SEQ ID:10168, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15821] Another function of GAM94 is therefore inhibition of Sh3 domain binding glutamic acid-rich protein like 2 (SH3BGRL2, Accession NP_113657.1) . Accordingly, utili-

ties of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL2.

[15822] Sialic acid binding ig-like lectin 5 (SIGLEC5, Accession NP_003821.1) is another GAM94 target gene, herein designated TARGET GENE. SIGLEC5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIGLEC5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIGLEC5 BINDING SITE, designated SEQ ID:18811, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15823] Another function of GAM94 is therefore inhibition of Sialic acid binding ig-like lectin 5 (SIGLEC5, Accession NP_003821.1), a gene which is a cell adhesion molecule for postnatal neural development. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIGLEC5.

[15824] The function of SIGLEC5 has been established by previous studies. The sialic acid- binding immunoglobulin- like lectins (SIGLECs), such as CD33 (OMIM Ref. No. 159590),

are a subgroup of the immunoglobulin (Ig) superfamily that mediate protein- carbohydrate interactions. They specifically interact with sialic acids in glycoproteins and glycolipids, with each SIGLEC having a particular preference for both the nature of the sialic acid and its glycosidic linkage to adjacent sugars. SIGLECs have similar structures, including extracellular Ig- like domains composed of an N- terminal V- set domain followed by varying numbers of C2- set domains. It appears that all SIGLECs have an unusual arrangement of conserved cysteine residues in the V- set and adjacent C2- set domains. Most SIGLECs are expressed uniquely within the hematopoietic system. By searching an EST database for cDNAs that encode proteins with sequence similarity to the CD33 protein, Cornish et al. (1998) identified a novel SIGLEC, which they named SIGLEC5. They isolated a full-length human macrophage SIGLEC5 cDNA encoding a deduced 551- amino acid protein with all the key structural features of SIGLECs. SIGLEC5 contains a signal peptide, 4 extracellular Ig- like domains consisting of an N- terminal V- set domain and 3 C2- set domains, a transmembrane domain, 2 cytoplasmic ITIM (immunoreceptor tyrosine-based inhibitory motif)- like motifs, and 8 potential N-

linked glycosylation sites. SIGLEC5 has high sequence similarity to CD33 and OBBP1 (SIGLEC6; 604405). Western blot analysis of neutrophil lysates indicated that SIGLEC5 exists as a disulfide- linked dimer of approximately 140 kD. Recombinant SIGLEC5 expressed in COS cells mediated sialic acid- dependent binding to human erythrocytes. SIGLEC5 bound to alpha- 2,3- and alpha- 2,6- linked sialic acid equally. Northern blot analysis detected 2 major SIGLEC5 transcripts of 2.4 and 3.4 kb in various tissues, with the highest levels in hematopoietic organs, notably bone marrow and spleen. SIGLEC5 protein was present on neutrophils but absent from leukemic cell lines representing early stages of myelomonocytic differentiation. By screening a human erythroleukemic cell line cDNA library with a full- length OBBP1 cDNA, Patel et al. (1999) isolated a cDNA encoding OBBP2. They stated that OBBP2 is identical to SIGLEC5 (Cornish et al., 1998). The deduced OBBP2 protein shares 59% and 56% sequence identity with OBBP1 and CD33, respectively. All 3 of these proteins have a cytoplasmic domain containing putative sites of tyrosine phosphorylation, including an immunoreceptor tyrosine kinase inhibitory motif and a motif found in SLAM (OMIM Ref. No. 603492) and SLAM- like proteins. Recom-

binant OBBP2 and CD33 bound weakly to leptin, whereas OBBP1 exhibited tight and specific binding to leptin. Northern blot analysis detected highest OBBP2 expression in peripheral blood leukocytes, with moderate to low expression in spleen, lung, and placenta.

[15825]

[15826] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15827] Cornish, A. L.; Freeman, S.; Forbes, G.; Ni, J.; Zhang, M.; Cepeda, M.; Gentz, R.; Augustus, M.; Carter, K. C.; Crocker, P. R. : Characterization of siglec- 5, a novel glycoprotein expressed on myeloid cells related to CD33. Blood 92: 2123- 2132, 1998. ; and

[15828] Patel, N.; Brinkman- Van der Linden, E. C. M.; Altmann, S. W.; Gish, K.; Balasubramanian, S.; Timans, J. C.; Peterson, D.; Bell, M. P.; Bazan, J. F.; Varki, A.; Kastelein, R. A. : OBBP1/Si.

[15829] Further studies establishing the function and utilities of SIGLEC5 are found in John Hopkins OMIM database record ID 604200, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sine oculis homeobox homolog 2 (drosophila) (SIX2, Accession

NP_058628.2) is another GAM94 target gene, herein designated TARGET GENE. SIX2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIX2 BINDING SITE, designated SEQ ID:9606, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15830] Another function of GAM94 is therefore inhibition of Sine oculis homeobox homolog 2 (drosophila) (SIX2, Accession NP_058628.2), a gene which may be involved in limb tendon and ligament development (by similarity). Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIX2.

[15831] The function of SIX2 has been established by previous studies. By screening a human genomic library with a human SIX1 cDNA (OMIM Ref. No. 601205), Boucher et al. (2000) identified the SIX2 gene. Using the SIX2 genomic sequence, they isolated a human fetus SIX2 cDNA. The predicted 291- amino acid SIX2 protein contains a SIX domain and a homeodomain. The human SIX2 protein is al-

most identical to the mouse Six2 protein. Northern blot analysis of human tissues detected strong expression of a major 2.2- kb SIX2 transcript in skeletal muscle, with weaker expression in pancreas. RT- PCR showed SIX2 expression in all human fetal tissues tested except lung. In adult tissues, RT- PCR revealed SIX2 expression in skeletal muscle, pancreas, ovary, and sclera; SIX2 expression was not detected in other regions of the adult eye and optic nerve or in adult heart, lung, kidney, liver, or breast. Boucher et al. (2000) determined that the human SIX2 gene contains 2 exons.

[15832]

[15833] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15834] Boucher, C. A.; Winchester, C. L.; Hamilton, G. M.; Winter, A. D.; Johnson, K. J.; Bailey, M. E. S. : Structure, mapping and expression of the human gene encoding the homeodomain protein, SIX2. Gene 247: 145- 151, 2000. ; and

[15835] Oliver, G.; Wehr, R.; Jenkins, N. A.; Copeland, N. G.; Cheyette, B. N. R.; Hartenstein, V.; Zipursky, S. L.; Gruss, P. : Homeobox genes and connective tissue patterning. Development 12.

[15836] Further studies establishing the function and utilities of SIX2 are found in John Hopkins OMIM database record ID 604994, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 11 (proton-coupled divalent metal ion transporters), member 2 (SLC11A2, Accession NP_000608.1) is another GAM94 target gene, herein designated TARGET GENE. SLC11A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC11A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC11A2 BINDING SITE, designated SEQ ID:3415, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15837] Another function of GAM94 is therefore inhibition of Solute carrier family 11 (proton-coupled divalent metal ion transporters), member 2 (SLC11A2, Accession NP_000608.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A2.

[15838] Solute carrier family 12 (potassium/chloride transporters), member 8 (SLC12A8, Accession NP_078904.1) is another

GAM94 target gene, herein designated TARGET GENE. SLC12A8 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC12A8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC12A8 BINDING SITE, designated SEQ ID:8454, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15839] Another function of GAM94 is therefore inhibition of Solute carrier family 12 (potassium/chloride transporters), member 8 (SLC12A8, Accession NP_078904.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A8.

[15840] Solute carrier family 14 (urea transporter), member 1 (kidd blood group) (SLC14A1, Accession NP_056949.1) is another GAM94 target gene, herein designated TARGET GENE. SLC14A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC14A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of SLC14A1 BINDING SITE, designated SEQ ID:9326, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15841] Another function of GAM94 is therefore inhibition of Solute carrier family 14 (urea transporter), member 1 (kidd blood group) (SLC14A1, Accession NP_056949.1), a gene which is a urea transporters in spermatogenesis. and therefore may be associated with Urine concentration defect. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Urine concentration defect, and of other diseases and clinical conditions associated with SLC14A1.

[15842] The function of SLC14A1 has been established by previous studies. Tsukaguchi et al. (1997) undertook a characterization of the tissue distribution and physiologic role of the erythrocyte urea transporter, UT11, by studying its rat homolog and testing whether there are additional urea transporter isoforms expressed in rat kidney. Using a PCR- based homology cloning approach with degenerate primers corresponding to conserved regions of the UT family of genes, they isolated a kidney urea transporter that appeared to be the rat homolog of human UT11. The rat gene, symbolized UT3 by them, was strongly ex-

pressed in the kidney. Furthermore, UT3 was expressed in testis, brain, bone marrow, and spleen. Its expression in the rat testis suggested a potential role for urea transporters in spermatogenesis. On in situ hybridization of testis, UT3 was detected in Sertoli cells associated with the early stages of spermatocyte development. The distribution in the kidneys suggested that UT3 is involved in counter- current exchange between ascending and descending vasa recta, to enhance the cortico- papillary osmolality gradient. Although Jk- null red blood cells have reduced urea permeability, the Jk deficiency is not associated with any obvious clinical syndrome except for a urine concentration defect (Sands et al., 1992) that probably results from the absence of the Jk protein expressed on endothelial cells of the vasa recta of kidney (Xu et al., 1997; Promeneur et al., 1996). Persons with the Jk- null phenotype are detected because antibody against Jk3 can develop after immunization by transfusion or pregnancy, and this antibody may cause immediate and delayed hemolytic transfusion reactions (Lucien et al. (2002)).

[15843]

[15844] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[15845] Tsukaguchi, H.; Shayakul, C.; Berger, U. V.; Tokui, T.; Brown, D.; Hediger, M. A. : Cloning and characterization of the urea transportation UT3: localization in rat kidney and testis. J. Clin. Invest. 99: 1506- 1515, 1997. ; and

[15846] Sands, J. M.; Gargus, J. J.; Frohlich, O.; Gunn, R. B.; Kokko, J. P. : Urinary concentrating ability in patients with Jk(a/b) blood type who lack carrier- mediated urea transport. J. Am. Soc.

[15847] Further studies establishing the function and utilities of SLC14A1 are found in John Hopkins OMIM database record ID 111000, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 17 (sodium phosphate), member 3 (SLC17A3, Accession NP_006623.1) is another GAM94 target gene, herein designated TARGET GENE. SLC17A3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC17A3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC17A3 BINDING SITE, designated SEQ ID:9674, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA,

also designated SEQ ID:332.

[15848] Another function of GAM94 is therefore inhibition of Solute carrier family 17 (sodium phosphate), member 3 (SLC17A3, Accession NP_006623.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A3.

[15849] Solute carrier family 28 (sodium-coupled nucleoside transporter), member 2 (SLC28A2, Accession NP_004203.1) is another GAM94 target gene, herein designated TARGET GENE. SLC28A2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC28A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC28A2 BINDING SITE, designated SEQ ID:12812, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15850] Another function of GAM94 is therefore inhibition of Solute carrier family 28 (sodium-coupled nucleoside transporter), member 2 (SLC28A2, Accession NP_004203.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with SLC28A2.

[15851] Solute carrier family 38, member 3 (SLC38A3, Accession NP_006832.1) is another GAM94 target gene, herein designated TARGET GENE. SLC38A3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC38A3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC38A3 BINDING SITE, designated SEQ ID:14679, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15852] Another function of GAM94 is therefore inhibition of Solute carrier family 38, member 3 (SLC38A3, Accession NP_006832.1), a gene which involves H+ exchange and Na+ cotransport, mediates glutamine efflux and uptake. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A3.

[15853] The function of SLC38A3 has been established by previous studies. The amino acid glutamine has a central role in nitrogen metabolism. Although the molecular mechanisms responsible for its transport across cell membranes

are poorly understood, classical amino acid transport system N appears particularly important. Using intracellular pH measurements, Chaudhry et al. (1999) identified an orphan protein, which they called SN1, related to the vesicular GABA transporter (VGAT) as system N Functional analysis by Chaudhry et al. (1999) showed that this protein involves H+ exchange as well as Na+ cotransport and, under physiologic conditions, mediates glutamine efflux as well as uptake. Together with the pattern of SN1 expression, these unusual properties suggested novel physiologic roles for system N in nitrogen metabolism and synaptic transmission

[15854]

[15855] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

3p21.3: identification and evaluation of the resident candidate tumor suppressor genes.

[15858] Further studies establishing the function and utilities of SLC38A3 are found in John Hopkins OMIM database record ID 604437, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 38, member 5 (SLC38A5, Accession NP_277053.1) is another GAM94 target gene, herein designated TARGET GENE. SLC38A5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC38A5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC38A5 BINDING SITE, designated SEQ ID:13273, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15859] Another function of GAM94 is therefore inhibition of Solute carrier family 38, member 5 (SLC38A5, Accession NP_277053.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A5.

[15860] Solute carrier family 6 (neurotransmitter transporter, cre-

atine), member 8 (SLC6A8, Accession NP_005620.1) is another GAM94 target gene, herein designated TARGET GENE. SLC6A8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC6A8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC6A8 BINDING SITE, designated SEQ ID:17109, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15861] Another function of GAM94 is therefore inhibition of Solute carrier family 6 (neurotransmitter transporter, creatine), member 8 (SLC6A8, Accession NP_005620.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A8.

[15862] Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily a, member 5 (SMARCA5, Accession NP_003592.2) is another GAM94 target gene, herein designated TARGET GENE. SMARCA5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SMARCA5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMARCA5 BINDING SITE, designated SEQ ID:8202, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15863] Another function of GAM94 is therefore inhibition of Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily a, member 5 (SMARCA5, Accession NP_003592.2), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCA5.

[15864] The function of SMARCA5 has been established by previous studies. Poot et al. (2000) identified SMARCA5, which they called SNF2H, within a chromatin remodeling complex, CHRAC, purified from HeLa cell nuclear extracts. They confirmed an interaction between SMARCA5 and ACF1 (BAZ1A). Two small histone- fold proteins, CHRAC17 (POLE3; 607267) and CHRAC15 (CHRAC1; 607268), copurified with the complex, and the authors showed that these proteins form a DNA- binding heterodimer. Poot et al. (2000) determined that the purified complex could mobilize nucleosomes into a regularly

spaced nucleosomal array and that the spacing activity was strictly ATP- dependent. By Western blot analysis of protein expression levels in several human and mammalian cell lines, Bozhenok et al. (2002) determined that SMARCA5 interacts with BAZ1B (OMIM Ref. No. 605681). In vitro analysis of the mouse Smarca5- Baz1b complex showed that, in the presence of ATP, the complex can create regular nucleosomal arrays from irregular chromatin

[15865]

[15866] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15867] Bozhenok, L.; Wade, P. A.; Varga- Weisz, P. : WSTF- ISWI chromatin remodeling complex targets heterochromatic replication foci. EMBO J. 21: 2231- 2241, 2002. ; and

[15868] Poot, R. A.; Dellaire, G.; Hulsmann, B. B.; Grimaldi, M. A.; Corona, D. F. V.; Becker, P. B.; Bickmore, W. A.; Varga-Weisz, P. D. : HuCHRAC, a human ISWI chromatin remodelling complex cont.

[15869] Further studies establishing the function and utilities of SMARCA5 are found in John Hopkins OMIM database record ID 603375, and in cited publications listed in Table 5, which are hereby incorporated by reference.Swi/snf re-

lated, matrix associated, actin dependent regulator of chromatin, subfamily f, member 1 (SMARCF1, Accession NP_060920.4) is another GAM94 target gene, herein designated TARGET GENE. SMARCF1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SMARCF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMARCF1 BINDING SITE, designated SEQ ID:19730, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15870] Another function of GAM94 is therefore inhibition of Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily f, member 1 (SMARCF1, Accession NP_060920.4) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCF1.

[15871] Small nuclear rna activating complex, polypeptide 1, 43kda (SNAPC1, Accession NP_003073.1) is another GAM94 target gene, herein designated TARGET GENE. SNAPC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNAPC1, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNAPC1 BINDING SITE, designated SEQ ID:11862, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15872] Another function of GAM94 is therefore inhibition of Small nuclear rna activating complex, polypeptide 1, 43kda (SNAPC1, Accession NP_003073.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAPC1.

[15873] Synuclein, alpha (non a4 component of amyloid precursor) (SNCA, Accession NP_009292.1) is another GAM94 target gene, herein designated TARGET GENE. SNCA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNCA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNCA BINDING SITE, designated SEQ ID:11031, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15874] Another function of GAM94 is therefore inhibition of

Synuclein, alpha (non a4 component of amyloid precursor) (SNCA, Accession NP_009292.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNCA.

[15875] Synuclein, alpha (non a4 component of amyloid precursor) (SNCA, Accession NP_000336.1) is another GAM94 target gene, herein designated TARGET GENE. SNCA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNCA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNCA BINDING SITE, designated SEQ ID:11031, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15876] Another function of GAM94 is therefore inhibition of Synuclein, alpha (non a4 component of amyloid precursor) (SNCA, Accession NP_000336.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNCA.

[15877] SNW1 (Accession NP_036377.1) is another GAM94 target gene, herein designated TARGET GENE. SNW1 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by SNW1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNW1 BINDING SITE, designated SEQ ID:9744, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15878] Another function of GAM94 is therefore inhibition of SNW1 (Accession NP_036377.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNW1.

[15879] Sorting nexin 9 (SNX9, Accession NP_057308.1) is another GAM94 target gene, herein designated TARGET GENE. SNX9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNX9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNX9 BINDING SITE, designated SEQ ID:16044, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15880] Another function of GAM94 is therefore inhibition of Sorting nexin 9 (SNX9, Accession NP_057308.1) . Accordingly,

utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX9.

[15881] Sry (sex determining region y)-box 9 (campomelic dysplasia, autosomal sex-reversal) (SOX9, Accession NP_000337.1) is another GAM94 target gene, herein designated TARGET GENE. SOX9 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SOX9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SOX9 BINDING SITE, designated SEQ ID:3166, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15882] Another function of GAM94 is therefore inhibition of Sry (sex determining region y)-box 9 (campomelic dysplasia, autosomal sex-reversal) (SOX9, Accession NP_000337.1), a gene which regulates the expression of other genes involved in chondrogenesis. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX9.

[15883] The function of SOX9 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM63.1.Spermatogenesis associated 1 (SPATA1, Accession NP_071749.1) is another GAM94 target gene, herein designated TARGET GENE. SPATA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPATA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPATA1 BINDING SITE, designated SEQ ID:18673, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15884] Another function of GAM94 is therefore inhibition of Spermatogenesis associated 1 (SPATA1, Accession NP_071749.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPATA1.

[15885] Sprouty homolog 3 (drosophila) (SPRY3, Accession NP_005831.1) is another GAM94 target gene, herein designated TARGET GENE. SPRY3 BINDING SITE1 and SPRY3 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SPRY3, corresponding to target binding sites such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPRY3 BINDING SITE1 and SPRY3 BINDING SITE2, designated SEQ ID:15586 and SEQ ID:9428 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15886] Another function of GAM94 is therefore inhibition of Sprouty homolog 3 (drosophila) (SPRY3, Accession NP_005831.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRY3.

[15887] Serum response factor (c-fos serum response element-binding transcription factor) (SRF, Accession NP_003122.1) is another GAM94 target gene, herein designated TARGET GENE. SRF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SRF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRF BINDING SITE, designated SEQ ID:844, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15888] Another function of GAM94 is therefore inhibition of

Serum response factor (c-fos serum response element-binding transcription factor) (SRF, Accession NP_003122.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRF.

[15889] SRGAP2 (Accession NP_055665.1) is another GAM94 target gene, herein designated TARGET GENE. SRGAP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SRGAP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRGAP2 BINDING SITE, designated SEQ ID:16111, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15890] Another function of GAM94 is therefore inhibition of SRGAP2 (Accession NP_055665.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRGAP2.

[15891] Sarcalumenin (SRL, Accession XP_064152.3) is another GAM94 target gene, herein designated TARGET GENE. SRL BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SRL, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRL BINDING SITE, designated SEQ ID:16356, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15892] Another function of GAM94 is therefore inhibition of Sarcalumenin (SRL, Accession XP_064152.3) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRL.

[15893] SRPUL (Accession NP_055282.1) is another GAM94 target gene, herein designated TARGET GENE. SRPUL BINDING SITE1 and SRPUL BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SRPUL, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRPUL BINDING SITE1 and SRPUL BINDING SITE2, designated SEQ ID:13474 and SEQ ID:8925 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15894] Another function of GAM94 is therefore inhibition of SR-

PUL (Accession NP_055282.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRPUL.

[15895] SSH1 (Accession NP_061857.1) is another GAM94 target gene, herein designated TARGET GENE. SSH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SSH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SSH1 BINDING SITE, designated SEQ ID:1987, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15896] Another function of GAM94 is therefore inhibition of SSH1 (Accession NP_061857.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH1.

[15897] Signal sequence receptor, beta (translocon-associated protein beta) (SSR2, Accession NP_003136.1) is another GAM94 target gene, herein designated TARGET GENE. SSR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SSR2, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SSR2 BINDING SITE, designated SEQ ID:9632, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15898] Another function of GAM94 is therefore inhibition of Signal sequence receptor, beta (translocon-associated protein beta) (SSR2, Accession NP_003136.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSR2.

[15899] Stanniocalcin 2 (STC2, Accession NP_003705.1) is another GAM94 target gene, herein designated TARGET GENE. STC2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by STC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STC2 BINDING SITE, designated SEQ ID:19667, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15900] Another function of GAM94 is therefore inhibition of Stanniocalcin 2 (STC2, Accession NP_003705.1) . Accordingly,

utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STC2.

[15901] Stathmin-like 4 (STMN4, Accession NP_110422.2) is another GAM94 target gene, herein designated TARGET GENE. STMN4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STMN4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STMN4 BINDING SITE, designated SEQ ID:18271, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15902] Another function of GAM94 is therefore inhibition of Stathmin-like 4 (STMN4, Accession NP_110422.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STMN4.

[15903] Surfeit 6 (SURF6, Accession NP_006744.2) is another GAM94 target gene, herein designated TARGET GENE. SURF6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SURF6, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SURF6 BINDING SITE, designated SEQ ID:10512, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15904] Another function of GAM94 is therefore inhibition of Surfeit 6 (SURF6, Accession NP_006744.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURF6.

[15905] SV2A (Accession NP_055664.1) is another GAM94 target gene, herein designated TARGET GENE. SV2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SV2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SV2A BINDING SITE, designated SEQ ID:17251, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15906] Another function of GAM94 is therefore inhibition of SV2A (Accession NP_055664.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with SV2A.

[15907] Synaptogyrin 1 (SYNGR1, Accession NP_663783.1) is another GAM94 target gene, herein designated TARGET GENE. SYNGR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SYNGR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYNGR1 BINDING SITE, designated SEQ ID:5970, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15908] Another function of GAM94 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NP_663783.1), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1.

[15909] The function of SYNGR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Synaptotagmin xi (SYT11, Accession

NP_689493.2) is another GAM94 target gene, herein designated TARGET GENE. SYT11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYT11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYT11 BINDING SITE, designated SEQ ID:10869, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15910] Another function of GAM94 is therefore inhibition of Synaptotagmin xi (SYT11, Accession NP_689493.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT11.

[15911] T-box 15 (TBX15, Accession NP_689593.1) is another GAM94 target gene, herein designated TARGET GENE. TBX15 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TBX15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBX15 BINDING SITE, designated SEQ ID:14891, to the nucleotide sequence of GAM94 RNA, herein designated

GAM RNA, also designated SEQ ID:332.

[15912] Another function of GAM94 is therefore inhibition of T-box 15 (TBX15, Accession NP_689593.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX15.

[15913] T-box 19 (TBX19, Accession NP_005140.1) is another GAM94 target gene, herein designated TARGET GENE. TBX19 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TBX19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBX19 BINDING SITE, designated SEQ ID:12762, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15914] Another function of GAM94 is therefore inhibition of T-box 19 (TBX19, Accession NP_005140.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX19.

[15915] Teratocarcinoma-derived growth factor 1 (TDGF1, Accession NP_003203.1) is another GAM94 target gene, herein

designated TARGET GENE. TDGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TDGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TDGF1 BINDING SITE, designated SEQ ID:5595, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15916] Another function of GAM94 is therefore inhibition of Teratocarcinoma-derived growth factor 1 (TDGF1, Accession NP_003203.1), a gene which can play a role in the determination of the epiblastic cells that subsequently give rise to the mesoderm. and therefore may be associated with Forebrain defects. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Forebrain defects, and of other diseases and clinical conditions associated with TDGF1.

[15917] The function of TDGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.TED (Accession NP_056501.1) is another GAM94 target gene, herein designated TARGET GENE. TED BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by TED, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TED BINDING SITE, designated SEQ ID:8214, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15918] Another function of GAM94 is therefore inhibition of TED (Accession NP_056501.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TED.

[15919] TEM8 (Accession NP_444262.1) is another GAM94 target gene, herein designated TARGET GENE. TEM8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TEM8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TEM8 BINDING SITE, designated SEQ ID:7297, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15920] Another function of GAM94 is therefore inhibition of TEM8 (Accession NP_444262.1), a gene which is a tumor- spe-

cific endothelial marker and therefore may be associated with Colorectal cancer. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of Colorectal cancer, and of other diseases and clinical conditions associated with TEM8.

[15921] The function of TEM8 has been established by previous studies. St. Croix et al. (2000) compared gene expression patterns of endothelial cells derived from blood vessels of normal and malignant colorectal tissues to identify genes involved in tumor angiogenesis. Among the genes they identified was TEM8, which encodes a 564- amino acid protein. Bradley et al. (2001) isolated a cDNA encoding ATR and determined that the first 364 amino acids of the 368- amino acid ATR protein are identical to those of TEM8. The C- terminal ends of the ATR and TEM8 proteins then diverge, presumably due to alternative splicing, such that ATR has a cytoplasmic tail of only 25 amino acids, whereas TEM8 has a cytoplasmic tail of 221 amino acids. (Bradley et al. (2001) noted in proof that another apparently full- length ATR/TEM8- related cDNA clone (GenBank BC01207) encodes a protein with yet another C- terminal end.) The ATR protein contains a 27- amino acid signal peptide; a 293- amino acid extracellular domain

with 3 putative end- length glycosylation sites; and a 23-amino acid putative transmembrane region followed by the short cytoplasmic tail. An extracellular von Willebrand factor type A (VWA) domain is located between residues 44 and 216 of the ATR protein. The cytoplasmic tail of ATR contains an acidic cluster (EESEE) similar to a motif in the cytoplasmic tail of furin (OMIM Ref. No. 136950) that specifies basolateral sorting of this protease in polarized epithelial cells. The mouse homolog of ATR/TEM8 is highly related to the human clones, showing more than 98% sequence identity in the extracellular domain. ATR and/or TEM8 is expressed in a number of different tissues, including central nervous system, heart, lung, and lymphocytes. Bradley et al. (2001) confirmed that the VWA domain of ATR binds directly to the protective antigen of anthrax, suggesting that ATR may also function as a protective antigen receptor. They suggested that the finding that the soluble VWA domain of ATR inhibits toxin action, coupled with the use of the cloned receptor as a tool for identifying inhibitors of the protective antigen- receptor interaction, holds promise for the development of novel approaches for the treatment of anthrax.

[15922]

[15923] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15924] St. Croix, B.; Rago, C.; Velculescu, V.; Traverso, G.; Romans, K. E.; Montgomery, E.; Lal, A.; Riggins, G. J.; Lengauer, C.; Vogelstein, B.; Kinzler, K. W. : Genes expressed in human tumor endothelium. Science 289: 1197- 1202, 2000. ; and

[15925] Bradley, K. A.; Mogridge, J.; Mourez, M.; Collier, R. J.; Young, J. A. T. : Identification of the cellular receptor for anthrax toxin. Nature 414: 160- 161, 2001.

[15926] Further studies establishing the function and utilities of TEM8 are found in John Hopkins OMIM database record ID 606410, and in cited publications listed in Table 5, which are hereby incorporated by reference.Telomeric repeat binding factor 2, interacting protein (TERF2IP, Accession NP_061848.1) is another GAM94 target gene, herein designated TARGET GENE. TERF2IP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TERF2IP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TERF2IP BINDING SITE, desig-

nated SEQ ID:4291, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15927] Another function of GAM94 is therefore inhibition of Telomeric repeat binding factor 2, interacting protein (TERF2IP, Accession NP_061848.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERF2IP.

[15928] Transforming growth factor, alpha (TGFA, Accession NP_003227.1) is another GAM94 target gene, herein designated TARGET GENE. TGFA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGFA BINDING SITE, designated SEQ ID:6056, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15929] Another function of GAM94 is therefore inhibition of Transforming growth factor, alpha (TGFA, Accession NP_003227.1), a gene which is able to bind to the egf receptor and to act synergistically with tgf beta to promote anchorage- independent cell proliferation in soft agar.

Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFA.

[15930] The function of TGFA has been established by previous studies. Ellis et al. (1987) presented evidence that TGFA plays a role in certain paraneoplastic manifestations of melanoma: the sign of Leser- Trelat (the sudden appearance of, or increase in the number and size of, seborrheic keratoses), acanthosis nigricans, and eruptive acrochordons (sudden onset of multiple skin tags). Fernandez-Larrea et al. (1999) used the 2- hybrid screen to identify pro- TGF- alpha cytoplasmic domain- binding proteins, which they referred to as TACIPs (pro- TGF- alpha cytoplasmic domain- interacting proteins), involved in the trafficking of pro- TGF- alpha. They cloned 2 such proteins, which they designated TACIP1 (OMIM Ref. No. 601017) and TACIP18 (OMIM Ref. No. 602217). The circadian clock in the suprachiasmatic nucleus is thought to drive daily rhythms of behavior by secreting factors that act locally within the hypothalamus. In a systematic screen, Kramer et al. (2001) identified TGFA as a likely suprachiasmatic nucleus inhibitor of locomotion. TGFA is expressed rhythmically in the suprachiasmatic nucleus,

and when infused into the third ventricle it reversibly inhibited locomotor activity and disrupted circadian sleep-wake cycles. These actions were mediated by EGF receptors on neurons in the hypothalamic subparaventricular zone. Mice with a hypomorphic EGF receptor mutation exhibited excessive daytime locomotor activity and failed to suppress activity when exposed to light. Kramer et al. (2001) concluded that their results implicate EGF receptor signaling in the daily control of locomotor activity. They identified a neural circuit in the hypothalamus that likely mediates the regulation of behavior both by the suprachiasmatic nucleus and the retina using TGFA and EGF receptors in the retinohypothalamic tract.

[15931]

[15932] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15933] Fernandez- Larrea, J.; Merlos- Suarez, A.; Urena, J. M.; Baselga, J.; Arribas, J. : A role for a PDZ protein in the early secretory pathway for the targeting of proTGF- alpha to the cell surface. Molec. Cell 3: 423- 433, 1999. ; and

[15934] Kramer, A.; Yang, F.- C.; Snodgrass, P.; Li, X.; Scammell, T. E.; Davis, F. C.; Weitz, C. J. : Regulation of daily locomo-

tor activity and sleep by hypothalamic EGF receptor signaling. S.

[15935] Further studies establishing the function and utilities of TGFA are found in John Hopkins OMIM database record ID 190170, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transglutaminase 3 (e polypeptide, protein-glutamine-gamma-glutamyltransferase) (TGM3, Accession NP_003236.1) is another GAM94 target gene, herein designated TARGET GENE. TGM3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TGM3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGM3 BINDING SITE, designated SEQ ID:14294, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15936] Another function of GAM94 is therefore inhibition of Transglutaminase 3 (e polypeptide, protein-glutamine-gamma-glutamyltransferase) (TGM3, Accession NP_003236.1), a gene which is cross- links structural proteins and forms the cornified cell envelope. Accordingly, utilities of GAM94 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with TGM3.

[15937] The function of TGM3 has been established by previous studies. Kim et al. (1994) demonstrated that TGM3 is encoded by a gene of 42.8 kb containing 13 exons. Kim et al. (1994) compared the exon/intron organization with that of the other transglutaminase genes and suggested on this basis and on the basis of sequence homologies that TGM2 and TGM3 belong to a branch of a phylogenetic tree distinct from other transglutaminases. Using a combination of primer extension and PCR with degenerate oligonucleotide primers based on the partial protein sequence of guinea pig TGase3, Kim et al. (1993) isolated partial TGase3 cDNAs from newborn mouse and human foreskin epidermis. The authors used a combination of techniques to clone additional cDNAs corresponding to the entire coding regions of both human and mouse TGase3. The predicted proteins contain 692 amino acids and are 75% identical. Most of the sequence variation occurs in the vicinity of the proteolytic activation site, which lies at the most flexible and hydrophilic region of the molecule. Kim et al. (1993) suggested that cleavage of this exposed flexible hinge region promotes a conforma-

tional change in the protein to a more compact form, resulting in activation of the enzyme. When expressed in yeast cells, human TGase3 exhibited significant transglutaminase activity. Northern blot analysis revealed that the 2.9- kb TGase3 mRNA is expressed in human foreskin and in mouse epidermis and hair follicles. TGase3 expression in mammalian cells was regulated by calcium, as with other late epidermal differentiation products such as loricrin (OMIM Ref. No. 152445) and profilaggrin (OMIM Ref. No. 135940), suggesting to the authors that TGase3 is responsible for the later stages of cell envelope formation in the epidermis and hair follicle.

[15938]

[15939] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15940] Kim, I.- G.; Lee, S.- C.; Lee, J.- H.; Yang, J.- M.; Chung, S.- I.; Steinert, P. M. : Structure and organization of the human transglutaminase 3 gene: evolutionary relationship to the transglutaminase family. J. Invest. Derm. 103: 137- 142, 1994. ; and

[15941] Kim, I.- G.; Gorman, J. J.; Park, S.- C.; Chung, S.- I.; Steinert, P. M. : The deduced sequence of the novel protransg-

lutaminase E (TGase3) of human and mouse. J. Biol. Chem. 268: 12682- 126.

[15942] Further studies establishing the function and utilities of TGM3 are found in John Hopkins OMIM database record ID 600238, and in cited publications listed in Table 5, which are hereby incorporated by reference.THSD2 (Accession NP_116173.2) is another GAM94 target gene, herein designated TARGET GENE. THSD2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by THSD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of THSD2 BINDING SITE, designated SEQ ID:2496, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15943] Another function of GAM94 is therefore inhibition of THSD2 (Accession NP_116173.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THSD2.

[15944] Thiamine triphosphatase (THTPA, Accession NP_077304.1) is another GAM94 target gene, herein designated TARGET GENE. THTPA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by THTPA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of THTPA BINDING SITE, designated SEQ ID:2304, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15945] Another function of GAM94 is therefore inhibition of Thiamine triphosphatase (THTPA, Accession NP_077304.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THTPA.

[15946] Transducin-like enhancer of split 1 (e(sp1) homolog, drosophila) (TLE1, Accession NP_005068.2) is another GAM94 target gene, herein designated TARGET GENE. TLE1 BINDING SITE1 and TLE1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TLE1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TLE1 BINDING SITE1 and TLE1 BINDING SITE2, designated SEQ ID:12325 and SEQ ID:2500 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15947] Another function of GAM94 is therefore inhibition of Transducin-like enhancer of split 1 (e(sp1) homolog, drosophila) (TLE1, Accession NP_005068.2), a gene which plays a role during epithelial differentiation. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLE1.

[15948] The function of TLE1 has been established by previous studies. Stifani et al. (1992) described human homologs of Drosophila groucho protein; these were designated TLE for 'transducin- like enhancer of split.' Miyasaka et al. (1993) reported the cDNA cloning, nucleotide and deduced amino acid sequencing, and tissue- specific expression of mouse and human TLE genes (also known as ESG for 'enhancer of split groucho'). By Southern blot analysis of genomic DNA from human/Chinese hamster somatic hybrid cell lines, Miyasaka et al. (1993) mapped the human TLE1 gene to chromosome 9 and the TLE3 gene (OMIM Ref. No. 600190) to chromosome 15. Although they mapped the TLE3 gene to 15q22, Liu et al. (1996) found that the TLE1 and TLE2 (OMIM Ref. No. 601041) genes are organized in a tandem array on 19p13.3. These assignments were determined by fluores-

cence in situ hybridization (FISH). Liu et al. (1996) showed that expression of individual TLE genes correlated with immature epithelial cells that are progressing toward that terminally differentiated state, suggesting a role during epithelial differentiation. In both normal tissues and tissues resulting from incorrect or incomplete maturation events (such as metaplastic and neoplastic transformations), TLE expression was elevated and coincided with 'Notch' (OMIM Ref. No. 190198) expression, implicating these molecules in the maintenance of the undifferentiated state in epithelial cells. By FISH, Liu et al. (1996) found a TLE- related gene on chromosome 9q22 and concluded that it represents a new TLE gene or a pseudogene. [15949]

[15950] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15951] Miyasaka, H.; Choudhury, B. K.; Hou, E. W.; Li, S. S.- L. : Molecular cloning and expression of mouse and human cDNA encoding AES and ESG proteins with strong similarity to Drosophila enhancer of split groucho protein. Europ. J. Biochem. 216: 343- 352, 1993. ; and

[15952] Liu, Y.; Dehni, G.; Purcell, K. J.; Sokolow, J.; Carcangiu, M.

L.; Artavanis- Tsakonas, S.; Stifani, S. : Epithelial expression and chromosomal location of human TLE genes: implications f.

[15953] Further studies establishing the function and utilities of TLE1 are found in John Hopkins OMIM database record ID 600189, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transmembrane 7 superfamily member 2 (TM7SF2, Accession NP_003264.1) is another GAM94 target gene, herein designated TARGET GENE. TM7SF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TM7SF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TM7SF2 BINDING SITE, designated SEQ ID:5692, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15954] Another function of GAM94 is therefore inhibition of Transmembrane 7 superfamily member 2 (TM7SF2, Accession NP_003264.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM7SF2.

[15955] Transmembrane, prostate androgen induced rna (TMEPAI,

Accession NP_064567.2) is another GAM94 target gene, herein designated TARGET GENE. TMEPAI BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TMEPAI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMEPAI BINDING SITE, designated SEQ ID:11793, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15956] Another function of GAM94 is therefore inhibition of Transmembrane, prostate androgen induced rna (TMEPAI, Accession NP_064567.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEPAI.

[15957] Tumor necrosis factor receptor superfamily, member 13b (TNFRSF13B, Accession NP_036584.1) is another GAM94 target gene, herein designated TARGET GENE. TNFRSF13B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFRSF13B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

TNFRSF13B BINDING SITE, designated SEQ ID:17895, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15958] Another function of GAM94 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 13b (TNFRSF13B, Accession NP_036584.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF13B.

[15959] Trophoblast glycoprotein (TPBG, Accession NP_006661.1) is another GAM94 target gene, herein designated TARGET GENE. TPBG BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TPBG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TPBG BINDING SITE, designated SEQ ID:3490, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15960] Another function of GAM94 is therefore inhibition of Trophoblast glycoprotein (TPBG, Accession NP_006661.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with TPBG.

[15961] Tripartite motif-containing 38 (TRIM38, Accession NP_006346.1) is another GAM94 target gene, herein designated TARGET GENE. TRIM38 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRIM38, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM38 BINDING SITE, designated SEQ ID:19253, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15962] Another function of GAM94 is therefore inhibition of Tripartite motif-containing 38 (TRIM38, Accession NP_006346.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM38.

[15963] TRIM56 (Accession NP_112223.1) is another GAM94 target gene, herein designated TARGET GENE. TRIM56 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TRIM56, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM56 BINDING SITE, designated SEQ ID:17780, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15964] Another function of GAM94 is therefore inhibition of TRIM56 (Accession NP_112223.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM56.

[15965] TRIM56 (Accession XP_168586.1) is another GAM94 target gene, herein designated TARGET GENE. TRIM56 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TRIM56, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM56 BINDING SITE, designated SEQ ID:17780, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15966] Another function of GAM94 is therefore inhibition of TRIM56 (Accession XP_168586.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM56.

[15967] Transient receptor potential cation channel, subfamily m,

member 1 (TRPM1, Accession NP_002411.2) is another GAM94 target gene, herein designated TARGET GENE. TRPM1 BINDING SITE1 and TRPM1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TRPM1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRPM1 BINDING SITE1 and TRPM1 BINDING SITE2, designated SEQ ID:13846 and SEQ ID:12837 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15968] Another function of GAM94 is therefore inhibition of Transient receptor potential cation channel, subfamily m, member 1 (TRPM1, Accession NP_002411.2), a gene which is suggested to mediate calcium entry. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM1.

[15969] The function of TRPM1 has been established by previous studies. Hunter et al. (1998) cloned the human melastatin cDNA from a retina cDNA library. The gene encodes a 1,533- amino acid polypeptide with homology to mem-

bers of the transient receptor potential (Trp) family of calcium channels (see OMIM Ref. No. TRPC1; 602343). They also cloned the mouse melastatin genomic region and found that the promoter contains 4 consensus binding sites for the microphthalmia- associated transcription factor (MITF; 156845). One of these binding sites is an M box, a motif shared by the tyrosinase pigmentation genes (see OMIM Ref. No. TYRP1; 115501). Xu et al. (2001) found that TRPM1 mediates Ca(2+) entry when expressed in HEK293 cells. They found that a short form of TRPM1 interacts directly with and suppresses the activity of full-length TRPM1, possibly by inhibiting translocation of the full- length form to the plasma membrane. Using differential display analysis, Fang and Setaluri (2000) found TRPM1 among genes overexpressed in pigmented metastatic human melanoma cells treated with the differentiation inducer hexamethylene bisacetamide (HMBA). They found multiple short transcripts, from both the 5-prime and 3- prime ends of TRPM1, in melanocytes and pigmented metastatic melanoma cell lines. They found the full- length 5.4- kb transcript only in melanocytes. Northern blot and RT- PCR analysis demonstrated that HMBA treatment upregulates expression of the full- length and a

5- prime short form of TRPM1.

[15970]

[15971] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15972] Hunter, J. J.; Shao, J.; Smutko, J. S.; Dussault, B. J.; Nagle, D. L.; Woolf, E. A.; Holmgren, L. M.; Moore, K. J.; Shyjan, A. W. : Chromosomal localization and genomic characterization of the mouse melastatin gene (Mlsn1). Genomics 54: 116- 123, 1998. ; and

[15974] Further studies establishing the function and utilities of TRPM1 are found in John Hopkins OMIM database record ID 603576, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transient receptor potential cation channel, subfamily m, member 3 (TRPM3, Accession NP_079247.2) is another GAM94 target gene, herein designated TARGET GENE. TRPM3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRPM3, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRPM3 BINDING SITE, designated SEQ ID:13071, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15975] Another function of GAM94 is therefore inhibition of Transient receptor potential cation channel, subfamily m, member 3 (TRPM3, Accession NP_079247.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM3.

[15976] Txk tyrosine kinase (TXK, Accession NP_003319.1) is another GAM94 target gene, herein designated TARGET GENE. TXK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TXK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TXK BINDING SITE, designated SEQ ID:19521, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15977] Another function of GAM94 is therefore inhibition of Txk

tyrosine kinase (TXK, Accession NP_003319.1), a gene which is a non- receptor protein tyrosine kinase and a member of the Tec subfamily of Src kinases. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TXK.

[15978] The function of TXK has been established by previous studies. TXK expression is restricted to the Th1/Th0 subset of T lymphocytes with gamma- interferon (IFNG; 147570)- producing potential. By immunoblot analysis, Takeba et al. (2002) showed that TXK binds to the IFNG promoter in the region - 53 to - 39 bp from the transcription start site, a site distinct from previously characterized IFNG promoter binding locations. Luciferase reporter analysis indicated that phosphorylated TXK enhances IFNG transcriptional activity severalfold. Comparative sequence analysis established that this DNA- binding motif is conserved not only across mammalian species but also among human Th1 cell- associated protein genes, e.g., CCR5 (OMIM Ref. No. 601373) and TNF (OMIM Ref. No. 191160). Takeba et al. (2002) proposed that TXK acts as a Th1 cell- specific transcription factor

[15979] Animal model experiments lend further support to the

function of TXK. By homologous recombination, Schaeffer et al. (1999) disrupted the Rlk gene in mice. Heterozygotes were completely normal. Homozygous null Rlk mice showed increased amounts of Itk mRNA. The authors hypothesized that upregulation of related Tec kinases may partially compensate for the lack of Rlk. Schaeffer et al. (1999) therefore generated Rlk - /- Itk - /- mice by interbreeding. Itk- deficient mice have reduced numbers of mature T cells, particularly CD4+ cells, causing a decreased CD4- to- CD8 ratio. Rlk - /- Itk - /- mutants, however, had normal T cell numbers. Both CD4+ and CD8+ cell numbers are increased relative to Itk - /- mice. The persistent abnormal ratio of CD4+ to CD8+ cells suggested an altered regulation of lymphoid development and homeostasis in the double mutants. The double mutants had marked defects in T- cell receptor responses including proliferation, cytokine production, and apoptosis in vitro and adaptive immune responses to Toxoplasma gondii in vivo. Molecular events immediately downstream from the T- cell receptor were intact in Rlk - /- Itk - /- cells, but intermediate events including inositol trisphosphate production, calcium mobilization, and mitogen- activated protein kinase activation were impaired, establish-

ing Tec kinases as critical regulators of T- cell receptor signaling required for phospholipase C- gamma activation

[15980] It is appreciated that the abovementioned animal model for TXK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[15981] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15982] Takeba, Y.; Nagafuchi, H.; Takeno, M.; Kashiwakura, J.; Suzuki, N. : Txk, a member of nonreceptor tyrosine kinase of Tec family, acts as a Th1 cell- specific transcription factor and regulates IFN- gamma gene transcription. J. Immun. 168: 2365- 2370, 2002. ; and

[15983] Schaeffer, E. M.; Debnath, J.; Yap, G.; McVicar, D.; Liao, X. C.; Littman, D. R.; Sher, A.; Varmus, H. E.; Lenardo, M. J.; Schwartzberg, P. L. : Requirement for Tec kinases Rlk and Itk in.

[15984] Further studies establishing the function and utilities of TXK are found in John Hopkins OMIM database record ID 600058, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ubiquitin-activating enzyme e1 (a1s9t and bn75 temperature sensitivity com-

plementing) (UBE1, Accession NP_003325.2) is another GAM94 target gene, herein designated TARGET GENE. UBE1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by UBE1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE1 BINDING SITE, designated SEQ ID:2682, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15985] Another function of GAM94 is therefore inhibition of Ubiquitin-activating enzyme e1 (a1s9t and bn75 temperature sensitivity complementing) (UBE1, Accession NP_003325.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE1.

[15986] Ubiquitin-conjugating enzyme e2, j1 (ubc6 homolog, yeast) (UBE2J1, Accession NP_057105.1) is another GAM94 target gene, herein designated TARGET GENE. UBE2J1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UBE2J1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE2J1 BINDING SITE, designated SEQ ID:19768, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15987] Another function of GAM94 is therefore inhibition of Ubiquitin-conjugating enzyme e2, j1 (ubc6 homolog, yeast) (UBE2J1, Accession NP_057105.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2J1.

[15988] Upstream transcription factor 1 (USF1, Accession NP_009053.1) is another GAM94 target gene, herein designated TARGET GENE. USF1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by USF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of USF1 BINDING SITE, designated SEQ ID:17504, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15989] Another function of GAM94 is therefore inhibition of Upstream transcription factor 1 (USF1, Accession NP_009053.1), a gene which is a member of the helix-

loop- helix group of regulatory proteins and binds to DNA as a dimer. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USF1.

[15990] The function of USF1 has been established by previous studies. The upstream stimulatory factor is a ubiquitously expressed cellular transcription factor that binds to a symmetrical DNA sequence that is found in a variety of viral and cellular promoters. Purified USF consists of 2 related polypeptides of 43 and 44 kD (USF2; 600390). Microsequence analysis of purified USF protein allowed the cloning of the USF gene (Gregor et al., 1990). Hosts and pathogens evolve various responses for controlling infection and evading destruction, respectively. Using column chromatography, Zhong et al. (2001) identified a factor in Chlamydia trachomatis, the causative organism of trachoma and chronic urogenital infection, that degrades the transcription factors RFX5 (OMIM Ref. No. 601863) and USF1. The degradation of these host factors correlates with the suppression of MHC class I and class II antigen expression in infected cells, thereby suppressing the host immune response.

[15991]

[15992] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15993] Gregor, P. D.; Sawadogo, M.; Roeder, R. G. : The adenovirus major late transcription factor USF is a member of the helix- loop- helix group of regulatory proteins and binds to DNA as a dimer. Genes Dev. 4: 1730- 1740, 1990. ; and

[15994] Zhong, G.; Fan, P.; Ji, H.; Dong, F.; Huang, Y. : Identification of a chlamydial protease- like activity factor responsible for the degradation of host transcription factors. J. Exp. Med.

[15995] Further studies establishing the function and utilities of USF1 are found in John Hopkins OMIM database record ID 191523, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ubiquitin specific protease 14 (trna-guanine transglycosylase) (USP14, Accession NP_005142.1) is another GAM94 target gene, herein designated TARGET GENE. USP14 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by USP14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of USP14 BINDING SITE, designated SEQ ID:1660, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[15996] Another function of GAM94 is therefore inhibition of Ubiquitin specific protease 14 (trna-guanine transglycosylase) (USP14, Accession NP_005142.1), a gene which is similar to ubiquitin- specific cysteine (thiol) proteases and tRNA- guanine transglycosylase. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP14.

[15997] The function of USP14 has been established by previous studies. Using Tgt purified from rabbit erythrocytes, Deshpande et al. (1996) measured significant tRNA- guanine transglycosylase activity. Noting significant sequence similarity between Tgt and the deubiquitinating enzyme family, they proposed that Tgt may act as a signal to link deficiency of the transglycosylase product, queuosine, to the ubiquitin- dependent proteolytic pathway for the removal of abnormal or inappropriately expressed proteins. The International Radiation Hybrid Mapping Consortium mapped the USP14 gene to chromosome 18 (SJGC-11272). Wilson et al. (2002) stated that 2 human neuro-

logic disorders possibly involving alterations of synaptic function map to 18p near USP14: major affective disorder- 1 (MAFD1; 125480) and schizophrenia disorder 8 (SCZD8; 603206).

[15998] Animal model experiments lend further support to the function of USP14. Mice that are homozygous with respect to the spontaneous mutation ax(J) in the ataxia (ax) gene develop severe tremors by 2 to 3 weeks of age followed by hindlimb paralysis and death by 6 to 10 weeks of age. Wilson et al. (2002) showed that ax encodes Usp14, one of the large family of cysteine proteases that specifically feed ubiquitin conjugates. Although Usp14 can cleave a ubiquitin- tagged protein in vitro, it is unable to process polyubiquitin, which is belived to be associated with the protein aggregates seen in Parkinson disease, spinocerebellar ataxia type 1 (SCA1; 164400), and gracile axonal dystrophy (GAD) in mice. The physiologic substrate of Usp14 may therefore contain a monoubiquitin side chain, the removal of which would regulate processes such as protein localization and protein activity. Expression of Usp14 is altered in homozygous ax(J) mice as a result of the insertion of an intracisternal A particle (IAP) into intron 5 of Usp14. In contrast to other neurodegenerative disor-

ders such as Parkinson disease and SCA1 in humans and GAD in mice, neither ubiquitin- positive protein aggregates nor neuronal cell loss was detectable in the CNS of ax(J) mice. Instead, these mice had defects in synaptic transmission in both the central and peripheral nervous systems. These results suggested that ubiquitin proteases are important in regulating synaptic activity in mammals.

[15999] It is appreciated that the abovementioned animal model for USP14 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[16000] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16001] Deshpande, K. L.; Seubert, P. H.; Tillman, D. M.; Farkas, W. R.; Katze, J. R. : Cloning and characterization of cDNA encoding the rabbit tRNA- guanine transglycosylase 60- kilodalton subunit. Arch. Biochem. Biophys. 326: 1- 7, 1996. ; and

[16002] Wilson, S. M.; Bhattacharyya, B.; Rachel, R. A.; Coppola, V.; Tessarollo, L.; Householder, D. B.; Fletcher, C. F.; Miller, R. J.; Copeland, N. G.; Jenkins, N. A. : Synaptic defects in at.

[16003] Further studies establishing the function and utilities of

USP14 are found in John Hopkins OMIM database record ID 607274, and in cited publications listed in Table 5, which are hereby incorporated by reference.Vitamin d (1,25- dihydroxyvitamin d3) receptor (VDR, Accession NP_000367.1) is another GAM94 target gene, herein designated TARGET GENE. VDR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VDR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VDR BINDING SITE, designated SEQ ID:5451, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16004] Another function of GAM94 is therefore inhibition of Vitamin d (1,25- dihydroxyvitamin d3) receptor (VDR, Accession NP_000367.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDR.

[16005] Vascular endothelial growth factor b (VEGFB, Accession NP_003368.1) is another GAM94 target gene, herein designated TARGET GENE. VEGFB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VEGFB, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VEGFB BINDING SITE, designated SEQ ID:20042, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16006] Another function of GAM94 is therefore inhibition of Vascular endothelial growth factor b (VEGFB, Accession NP_003368.1), a gene which is a growth factor for endothelial cells. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEGFB.

[16007] The function of VEGFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.VGLL2 (Accession NP_703154.1) is another GAM94 target gene, herein designated TARGET GENE. VGLL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VGLL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VGLL2 BINDING SITE, designated SEQ ID:1486, to the nucleotide sequence of GAM94 RNA, herein designated

GAM RNA, also designated SEQ ID:332.

[16008] Another function of GAM94 is therefore inhibition of VGLL2 (Accession NP_703154.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VGLL2.

[16009] Vanin 1 (VNN1, Accession NP_004657.1) is another GAM94 target gene, herein designated TARGET GENE. VNN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VNN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VNN1 BINDING SITE, designated SEQ ID:11888, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16010] Another function of GAM94 is therefore inhibition of Vanin 1 (VNN1, Accession NP_004657.1), a gene which may regulate steps in thymus homing and play a role in mammalian sexual development. Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VNN1.

[16011] The function of VNN1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM65.1.Vacuolar protein sorting 41 (yeast) (VPS41, Accession NP_055211.1) is another GAM94 target gene, herein designated TARGET GENE. VPS41 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by VPS41, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VPS41 BINDING SITE, designated SEQ ID:18763, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16012] Another function of GAM94 is therefore inhibition of Vacuolar protein sorting 41 (yeast) (VPS41, Accession NP_055211.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS41.

[16013] WDFY2 (Accession NP_443182.1) is another GAM94 target gene, herein designated TARGET GENE. WDFY2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WDFY2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of WDFY2 BINDING SITE, designated SEQ ID:9273, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16014] Another function of GAM94 is therefore inhibition of WDFY2 (Accession NP_443182.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDFY2.

[16015] WDR22 (Accession XP_031102.1) is another GAM94 target gene, herein designated TARGET GENE. WDR22 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WDR22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WDR22 BINDING SITE, designated SEQ ID:14695, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16016] Another function of GAM94 is therefore inhibition of WDR22 (Accession XP_031102.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR22.

[16017] Wd repeat domain 9 (WDR9, Accession NP_061836.2) is

another GAM94 target gene, herein designated TARGET GENE. WDR9 BINDING SITE1 and WDR9 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by WDR9, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WDR9 BINDING SITE1 and WDR9 BINDING SITE2, designated SEQ ID:16206 and SEQ ID:2792 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16018] Another function of GAM94 is therefore inhibition of Wd repeat domain 9 (WDR9, Accession NP_061836.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR9.

[16019] Tryptophan rich basic protein (WRB, Accession NP_004618.2) is another GAM94 target gene, herein designated TARGET GENE. WRB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WRB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of WRB BINDING SITE, designated SEQ ID:17433, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16020] Another function of GAM94 is therefore inhibition of Tryptophan rich basic protein (WRB, Accession NP_004618.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WRB.

[16021] ZFHX2 (Accession XP_033370.7) is another GAM94 target gene, herein designated TARGET GENE. ZFHX2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZFHX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFHX2 BINDING SITE, designated SEQ ID:3631, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16022] Another function of GAM94 is therefore inhibition of ZFHX2 (Accession XP_033370.7) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFHX2.

[16023] ZIC4 (Accession NP_115529.2) is another GAM94 target

gene, herein designated TARGET GENE. ZIC4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZIC4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZIC4 BINDING SITE, designated SEQ ID:4435, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16024] Another function of GAM94 is therefore inhibition of ZIC4 (Accession NP_115529.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZIC4.

[16025] Zinc finger protein 228 (ZNF228, Accession NP_037512.1) is another GAM94 target gene, herein designated TARGET GENE. ZNF228 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ZNF228, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF228 BINDING SITE, designated SEQ ID:17645, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16026] Another function of GAM94 is therefore inhibition of Zinc finger protein 228 (ZNF228, Accession NP_037512.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF228.

[16027] Zinc finger protein 347 (ZNF347, Accession NP_115973.1) is another GAM94 target gene, herein designated TARGET GENE. ZNF347 BINDING SITE1 through ZNF347 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by ZNF347, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF347 BINDING SITE1 through ZNF347 BINDING SITE3, designated SEQ ID:13718, SEQ ID:6828 and SEQ ID:17666 respectively, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16028] Another function of GAM94 is therefore inhibition of Zinc finger protein 347 (ZNF347, Accession NP_115973.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF347.

[16029] Zinc finger protein 396 (ZNF396, Accession NP_665699.1)

is another GAM94 target gene, herein designated TARGET GENE. ZNF396 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF396, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF396 BINDING SITE, designated SEQ ID:12937, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16030] Another function of GAM94 is therefore inhibition of Zinc finger protein 396 (ZNF396, Accession NP_665699.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF396.

[16031] ZNF409 (Accession NP_055709.1) is another GAM94 target gene, herein designated TARGET GENE. ZNF409 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF409, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF409 BINDING SITE, designated SEQ ID:18512, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA,

also designated SEQ ID:332.

[16032] Another function of GAM94 is therefore inhibition of ZNF409 (Accession NP_055709.1) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF409.

[16033] Zinc finger protein 83 (hpf1) (ZNF83, Accession NP_060770.2) is another GAM94 target gene, herein designated TARGET GENE. ZNF83 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ZNF83, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF83 BINDING SITE, designated SEQ ID:5124, to the nucleotide sequence of GAM94 RNA, herein designated GAM RNA, also designated SEQ ID:332.

[16034] Another function of GAM94 is therefore inhibition of Zinc finger protein 83 (hpf1) (ZNF83, Accession NP_060770.2) . Accordingly, utilities of GAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF83.

[16035]

[16036] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, re-

ferred to here as Genomic Address Messenger 95 (GAM95), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16037] GAM95 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM95 was detected is described hereinabove with reference to Figs. 8-15.

[16038] GAM95 gene, herein designated GAM GENE, and GAM95 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[16039] GAM95 gene encodes a GAM95 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM95 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM95 precursor RNA is designated SEQ ID:104, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:104 is located at position 23786019 relative to chromosome 19.

[16040] GAM95 precursor RNA folds onto itself, forming GAM95 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16041] GAM95 precursor RNA folds onto itself, forming GAM95 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[16042] Nucleotide sequence of GAM95 precursor RNA, designated SEQ-ID: 104, and a schematic representation of a predicted secondary folding of GAM95 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[16043] An enzyme complex designated DICER COMPLEX, `dices` the GAM95 folded precursor RNA into GAM95 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA

segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM95 RNA is designated SEQ ID:273, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[16044] GAM95 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM95 target RNA, herein designated GAM TARGET RNA. GAM95 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16045] GAM95 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM95 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM95 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target

binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM95 RNA may have a different number of target binding sites in untranslated regions of a GAM95 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16046] The complementary binding of GAM95 RNA, herein designated GAM RNA, to target binding sites on GAM95 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM95 target RNA into GAM95 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16047] It is appreciated that GAM95 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM95 target genes. The mRNA of each one of this plurality of GAM95 target genes comprises one or more tar-

get binding sites, each having a nucleotide sequence which is at least partly complementary to GAM95 RNA, herein designated GAM RNA, and which when bound by GAM95 RNA causes inhibition of translation of respective one or more GAM95 target proteins.

[16048] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM95 gene, herein designated GAM GENE, on one or more GAM95 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16049] It is appreciated that specific functions and accordingly utilities of GAM95 correlate with, and may be deduced

from, the identity of the target genes which GAM95 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16050]

[16051]

[16052] LOC131000 (Accession) is a GAM95 target gene, herein designated TARGET GENE. LOC131000 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC131000, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC131000 BINDING SITE, designated SEQ ID:17288, to the nucleotide sequence of GAM95 RNA, herein designated GAM RNA, also designated SEQ ID:273.

[16053] A function of GAM95 is therefore inhibition of LOC131000 (Accession) . Accordingly, utilities of GAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131000.

[16054]

[16055] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, re-

ferred to here as Genomic Address Messenger 96 (GAM96), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16056] GAM96 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM96 was detected is described hereinabove with reference to Figs. 8-15.

[16057] GAM96 gene, herein designated GAM GENE, and GAM96 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[16058] GAM96 gene encodes a GAM96 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM96 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM96 precursor RNA is designated SEQ ID:121, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:121 is located at position 60893521 relative to chromosome 17.

[16059] GAM96 precursor RNA folds onto itself, forming GAM96 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16060] GAM96 precursor RNA folds onto itself, forming GAM96 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[16061] Nucleotide sequence of GAM96 precursor RNA, designated SEQ-ID: 121, and a schematic representation of a predicted secondary folding of GAM96 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[16062] An enzyme complex designated DICER COMPLEX, `dices` the GAM96 folded precursor RNA into GAM96 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA

segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: A) nucleotide sequence of GAM96 RNA is designated SEQ ID:394, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[16063] GAM96 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM96 target RNA, herein designated GAM TARGET RNA. GAM96 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16064] GAM96 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM96 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM96 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target

binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM96 RNA may have a different number of target binding sites in untranslated regions of a GAM96 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16065] The complementary binding of GAM96 RNA, herein designated GAM RNA, to target binding sites on GAM96 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM96 target RNA into GAM96 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16066] It is appreciated that GAM96 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM96 target genes. The mRNA of each one of this plurality of GAM96 target genes comprises one or more tar-

get binding sites, each having a nucleotide sequence which is at least partly complementary to GAM96 RNA, herein designated GAM RNA, and which when bound by GAM96 RNA causes inhibition of translation of respective one or more GAM96 target proteins.

[16067] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM96 gene, herein designated GAM GENE, on one or more GAM96 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16068] It is appreciated that specific functions and accordingly utilities of GAM96 correlate with, and may be deduced

from, the identity of the target genes which GAM96 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16069]

[16070]

[16071] Atp-binding cassette, sub-family a (abc1), member 1 (ABCA1, Accession NP_005493.2) is a GAM96 target gene, herein designated TARGET GENE. ABCA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ABCA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCA1 BINDING SITE, designated SEQ ID:14553, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16072] A function of GAM96 is therefore inhibition of Atp-binding cassette, sub-family a (abc1), member 1 (ABCA1, Accession NP_005493.2), a gene which camp- dependent and sulfonylurea- sensitive anion transporter. and therefore is associated with Tangier disease (high density lipoprotein deficiency type i). Accordingly, utilities of

GAM96 include diagnosis, prevention and treatment of Tangier disease (high density lipoprotein deficiency type i), and of other diseases and clinical conditions associated with ABCA1.

[16073] The function of ABCA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Atp-binding cassette, sub-family c (cftr/mrp), member 1 (ABCC1, Accession NP_004987.1) is another GAM96 target gene, herein designated TARGET GENE. ABCC1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABCC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCC1 BINDING SITE, designated SEQ ID:3827, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16074] Another function of GAM96 is therefore inhibition of Atp-binding cassette, sub-family c (cftr/mrp), member 1 (ABCC1, Accession NP_004987.1), a gene which may participate directly in the active transport of drugs into subcellular organelles or influence drug distribution indi-

rectly. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC1.

[16075] The function of ABCC1 has been established by previous studies. Cole et al. (1992) identified a transporter protein whose gene is overexpressed in a multidrug- resistant variant of the small cell lung cancer cell line NCI- H69. Unlike most tumor cell lines that are resistant to multiple chemotherapeutic agents, it did not overexpress the transmembrane transport protein P- glycoprotein (MDR1; 171050). Cole et al. (1992) isolated cDNA clones corresponding to mRNAs overexpressed in the resistant H69 cells. One cDNA hybridized to an mRNA of 7.8 to 8.2 kb that was expressed 100- to 200- fold higher in the resistant cells than in the drug- sensitive H69 cells. Overexpression was associated with amplification of the cognate gene. The cDNA contained a single open reading frame of 1,522 amino acids encoding a protein that they designated MRP, for 'multidrug resistance- associated protein.' Database analyses demonstrated similarities in primary sequence to the adenosine triphosphate (ATP)- binding cassette (ABC) superfamily of transport systems. Included in this superfamily are the genes for MDR1 and for the

cystic fibrosis transmembrane conductance regulator (CFTR; 602421). Northern blot analysis readily detected MRP transcripts in lung, testis, and peripheral blood mononuclear cells; MRP transcripts were below the level of detection in placenta, brain, kidney, salivary gland, uterus, liver, and spleen. By isotopic in situ hybridization, Cole et al. (1992) mapped the MRP1 gene to chromosome 16p13.1. Grant et al. (1997) located the MRP1 gene close to the short arm breakpoint of the pericentric inversion associated with the M4Eo subclass of acute myeloid leukemia and on the telomeric side of the MYH11 gene (OMIM Ref. No. 160745).

[16076]

[16077] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16078] Cole, S. P. C.; Bhardwaj, G.; Gerlach, J. H.; Mackie, J. E.; Grant, C. E.; Almquist, K. C.; Stewart, A. J.; Kurz, E. U.; Duncan, A. M. V.; Deeley, R. G. : Overexpression of a transporter gene in a multidrug- resistant human lung cancer cell line. Science 258: 1650- 1654, 1992. ; and

[16079] Grant, C. E.; Kurz, E. U.; Cole, S. P. C.; Deeley, R. G. : Analysis of the intron- exon organization of the human mul-

tidrug- resistance protein gene (MRP) and alternative splicing of its m.

[16080] Further studies establishing the function and utilities of ABCC1 are found in John Hopkins OMIM database record ID 158343, and in cited publications listed in Table 5, which are hereby incorporated by reference.Atp-binding cassette, sub-family c (cftr/mrp), member 1 (ABCC1, Accession NP_063956.1) is another GAM96 target gene, herein designated TARGET GENE. ABCC1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABCC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCC1 BINDING SITE, designated SEQ ID:3827, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16081] Another function of GAM96 is therefore inhibition of Atp-binding cassette, sub-family c (cftr/mrp), member 1 (ABCC1, Accession NP_063956.1), a gene which may participate directly in the active transport of drugs into subcellular organelles or influence drug distribution indirectly. Accordingly, utilities of GAM96 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with ABCC1.

[16082] The function of ABCC1 has been established by previous studies. Cole et al. (1992) identified a transporter protein whose gene is overexpressed in a multidrug- resistant variant of the small cell lung cancer cell line NCI- H69. Unlike most tumor cell lines that are resistant to multiple chemotherapeutic agents, it did not overexpress the transmembrane transport protein P- glycoprotein (MDR1; 171050). Cole et al. (1992) isolated cDNA clones corresponding to mRNAs overexpressed in the resistant H69 cells. One cDNA hybridized to an mRNA of 7.8 to 8.2 kb that was expressed 100- to 200- fold higher in the resistant cells than in the drug- sensitive H69 cells. Overexpression was associated with amplification of the cognate gene. The cDNA contained a single open reading frame of 1,522 amino acids encoding a protein that they designated MRP, for 'multidrug resistance- associated protein.' Database analyses demonstrated similarities in primary sequence to the adenosine triphosphate (ATP)- binding cassette (ABC) superfamily of transport systems. Included in this superfamily are the genes for MDR1 and for the cystic fibrosis transmembrane conductance regulator

(CFTR; 602421). Northern blot analysis readily detected MRP transcripts in lung, testis, and peripheral blood mononuclear cells; MRP transcripts were below the level of detection in placenta, brain, kidney, salivary gland, uterus, liver, and spleen. By isotopic in situ hybridization, Cole et al. (1992) mapped the MRP1 gene to chromosome 16p13.1. Grant et al. (1997) located the MRP1 gene close to the short arm breakpoint of the pericentric inversion associated with the M4Eo subclass of acute myeloid leukemia and on the telomeric side of the MYH11 gene (OMIM Ref. No. 160745).

[16083]

[16085] Cole, S. P. C.; Bhardwaj, G.; Gerlach, J. H.; Mackie, J. E.; Grant, C. E.; Almquist, K. C.; Stewart, A. J.; Kurz, E. U.; Duncan, A. M. V.; Deeley, R. G. : Overexpression of a transporter gene in a multidrug- resistant human lung cancer cell line. Science 258: 1650- 1654, 1992. ; and

[16086] Grant, C. E.; Kurz, E. U.; Cole, S. P. C.; Deeley, R. G. : Analysis of the intron- exon organization of the human multidrug- resistance protein gene (MRP) and alternative

splicing of its m.

[16087] Further studies establishing the function and utilities of ABCC1 are found in John Hopkins OMIM database record ID 158343, and in cited publications listed in Table 5, which are hereby incorporated by reference.Atp-binding cassette, sub-family c (cftr/mrp), member 1 (ABCC1, Accession NP_063955.1) is another GAM96 target gene, herein designated TARGET GENE. ABCC1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABCC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCC1 BINDING SITE, designated SEQ ID:3827, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16088] Another function of GAM96 is therefore inhibition of Atp-binding cassette, sub-family c (cftr/mrp), member 1 (ABCC1, Accession NP_063955.1), a gene which may participate directly in the active transport of drugs into subcellular organelles or influence drug distribution indirectly. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with ABCC1.

[16089] The function of ABCC1 has been established by previous studies. Cole et al. (1992) identified a transporter protein whose gene is overexpressed in a multidrug- resistant variant of the small cell lung cancer cell line NCI- H69. Unlike most tumor cell lines that are resistant to multiple chemotherapeutic agents, it did not overexpress the transmembrane transport protein P- glycoprotein (MDR1; 171050). Cole et al. (1992) isolated cDNA clones corresponding to mRNAs overexpressed in the resistant H69 cells. One cDNA hybridized to an mRNA of 7.8 to 8.2 kb that was expressed 100- to 200- fold higher in the resistant cells than in the drug- sensitive H69 cells. Overexpression was associated with amplification of the cognate gene. The cDNA contained a single open reading frame of 1,522 amino acids encoding a protein that they designated MRP, for 'multidrug resistance- associated protein.' Database analyses demonstrated similarities in primary sequence to the adenosine triphosphate (ATP)- binding cassette (ABC) superfamily of transport systems. Included in this superfamily are the genes for MDR1 and for the cystic fibrosis transmembrane conductance regulator (CFTR; 602421). Northern blot analysis readily detected

MRP transcripts in lung, testis, and peripheral blood mononuclear cells; MRP transcripts were below the level of detection in placenta, brain, kidney, salivary gland, uterus, liver, and spleen. By isotopic in situ hybridization, Cole et al. (1992) mapped the MRP1 gene to chromosome 16p13.1. Grant et al. (1997) located the MRP1 gene close to the short arm breakpoint of the pericentric inversion associated with the M4Eo subclass of acute myeloid leukemia and on the telomeric side of the MYH11 gene (OMIM Ref. No. 160745).

[16090]

[16091] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16092] Cole, S. P. C.; Bhardwaj, G.; Gerlach, J. H.; Mackie, J. E.; Grant, C. E.; Almquist, K. C.; Stewart, A. J.; Kurz, E. U.; Duncan, A. M. V.; Deeley, R. G. : Overexpression of a transporter gene in a multidrug- resistant human lung cancer cell line. Science 258: 1650- 1654, 1992. ; and

[16093] Grant, C. E.; Kurz, E. U.; Cole, S. P. C.; Deeley, R. G. : Analysis of the intron- exon organization of the human multidrug- resistance protein gene (MRP) and alternative splicing of its m.

[16094] Further studies establishing the function and utilities of ABCC1 are found in John Hopkins OMIM database record ID 158343, and in cited publications listed in Table 5, which are hereby incorporated by reference.Atp-binding cassette, sub-family c (cftr/mrp), member 1 (ABCC1, Accession NP_063957.1) is another GAM96 target gene, herein designated TARGET GENE. ABCC1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABCC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCC1 BINDING SITE, designated SEQ ID:3827, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16095] Another function of GAM96 is therefore inhibition of Atp-binding cassette, sub-family c (cftr/mrp), member 1 (ABCC1, Accession NP_063957.1), a gene which may participate directly in the active transport of drugs into subcellular organelles or influence drug distribution indirectly. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC1.

[16096] The function of ABCC1 has been established by previous studies. Cole et al. (1992) identified a transporter protein whose gene is overexpressed in a multidrug- resistant variant of the small cell lung cancer cell line NCI- H69. Unlike most tumor cell lines that are resistant to multiple chemotherapeutic agents, it did not overexpress the transmembrane transport protein P- glycoprotein (MDR1; 171050). Cole et al. (1992) isolated cDNA clones corresponding to mRNAs overexpressed in the resistant H69 cells. One cDNA hybridized to an mRNA of 7.8 to 8.2 kb that was expressed 100- to 200- fold higher in the resistant cells than in the drug- sensitive H69 cells. Overexpression was associated with amplification of the cognate gene. The cDNA contained a single open reading frame of 1,522 amino acids encoding a protein that they designated MRP, for 'multidrug resistance- associated protein.' Database analyses demonstrated similarities in primary sequence to the adenosine triphosphate (ATP)- binding cassette (ABC) superfamily of transport systems. Included in this superfamily are the genes for MDR1 and for the cystic fibrosis transmembrane conductance regulator (CFTR; 602421). Northern blot analysis readily detected MRP transcripts in lung, testis, and peripheral blood

mononuclear cells; MRP transcripts were below the level of detection in placenta, brain, kidney, salivary gland, uterus, liver, and spleen. By isotopic in situ hybridization, Cole et al. (1992) mapped the MRP1 gene to chromosome 16p13.1. Grant et al. (1997) located the MRP1 gene close to the short arm breakpoint of the pericentric inversion associated with the M4Eo subclass of acute myeloid leukemia and on the telomeric side of the MYH11 gene (OMIM Ref. No. 160745).

[16122] Further studies establishing the function and utilities of ABCC1 are found in John Hopkins OMIM database record ID 158343, and in cited publications listed in Table 5, which are hereby incorporated by reference.Actin binding

lim protein 1 (ABLIM1, Accession NP_006711.2) is another GAM96 target gene, herein designated TARGET GENE. ABLIM1 BINDING SITE1 and ABLIM1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ABLIM1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABLIM1 BINDING SITE1 and ABLIM1 BINDING SITE2, designated SEQ ID:1918 and SEQ ID:13766 respectively, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16123] Another function of GAM96 is therefore inhibition of Actin binding lim protein 1 (ABLIM1, Accession NP_006711.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM1.

[16124] Actin binding lim protein 1 (ABLIM1, Accession NP_006710.2) is another GAM96 target gene, herein designated TARGET GENE. ABLIM1 BINDING SITE1 and ABLIM1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ABLIM1, corresponding to target binding sites such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABLIM1 BINDING SITE1 and ABLIM1 BINDING SITE2, designated SEQ ID:13766 and SEQ ID:1918 respectively, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16125] Another function of GAM96 is therefore inhibition of Actin binding lim protein 1 (ABLIM1, Accession NP_006710.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM1.

[16126] Actin binding lim protein 1 (ABLIM1, Accession NP_006711.2) is another GAM96 target gene, herein designated TARGET GENE. ABLIM1 BINDING SITE1 and ABLIM1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ABLIM1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABLIM1 BINDING SITE1 and ABLIM1 BINDING SITE2, designated SEQ ID:13766 and SEQ ID:1918 respectively, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16127] Another function of GAM96 is therefore inhibition of Actin binding lim protein 1 (ABLIM1, Accession NP_006711.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM1.

[16128] Adenylate cyclase 6 (ADCY6, Accession NP_056085.1) is another GAM96 target gene, herein designated TARGET GENE. ADCY6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADCY6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE, designated SEQ ID:8443, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16129] Another function of GAM96 is therefore inhibition of Adenylate cyclase 6 (ADCY6, Accession NP_056085.1), a gene which this a membrane- bound, ca(2+)- inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY6.

[16130] The function of ADCY6 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.2.Adenylate cyclase 6 (ADCY6, Accession NP_066193.1) is another GAM96 target gene, herein designated TARGET GENE. ADCY6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADCY6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE, designated SEQ ID:8443, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16131] Another function of GAM96 is therefore inhibition of Adenylate cyclase 6 (ADCY6, Accession NP_066193.1), a gene which this a membrane- bound, ca(2+)- inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY6.

[16132] The function of ADCY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.2.A kinase (prka) anchor protein 13 (AKAP13,

Accession NP_658913.1) is another GAM96 target gene, herein designated TARGET GENE. AKAP13 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AKAP13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:13225, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16133] Another function of GAM96 is therefore inhibition of A kinase (prka) anchor protein 13 (AKAP13, Accession NP_658913.1), a gene which regulates subcellular localization of type II cAMP- dependent PKA. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13.

[16134] The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM54.1.A kinase (prka) anchor protein 13 (AKAP13, Accession NP_009131.2) is another GAM96 target gene, herein designated TARGET GENE. AKAP13 BINDING SITE is

a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AKAP13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:13225, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16135] Another function of GAM96 is therefore inhibition of A kinase (prka) anchor protein 13 (AKAP13, Accession NP_009131.2), a gene which regulates subcellular localization of type II cAMP- dependent PKA. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13.

[16136] The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM54.1.A kinase (prka) anchor protein 13 (AKAP13, Accession NP_006729.4) is another GAM96 target gene, herein designated TARGET GENE. AKAP13 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AKAP13, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:13225, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16137] Another function of GAM96 is therefore inhibition of A kinase (prka) anchor protein 13 (AKAP13, Accession NP_006729.4), a gene which regulates subcellular localization of type II cAMP- dependent PKA. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13.

[16138] The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM54.1.Aldehyde dehydrogenase 1 family, member a3 (ALDH1A3, Accession NP_000684.1) is another GAM96 target gene, herein designated TARGET GENE. ALDH1A3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALDH1A3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of ALDH1A3 BINDING SITE, designated SEQ ID:9790, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16139] Another function of GAM96 is therefore inhibition of Aldehyde dehydrogenase 1 family, member a3 (ALDH1A3, Accession NP_000684.1), a gene which plays a major role in the detoxification of aldehydes generated by alcohol metabolism and lipid peroxidation. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH1A3.

[16140] The function of ALDH1A3 has been established by previous studies. Hsu et al. (1994) identified and characterized the ALDH6 gene. The existence of this unique ALDH isozyme in human saliva and its polymorphism had previously been demonstrated. The ALDH6 cDNA is 3,457 bp long and contains an open reading frame encoding 512 amino acids. The deduced amino acid sequence shows that the protein is larger than human liver ALDH1 (OMIM Ref. No. 100640) by 11 residues at the N terminus, and the degree of identity between the 2 isozymes is 70% with an alignment of 500 amino acid residues. Northern blot analysis demonstrated that the ALDH6 gene is expressed

at low levels in many tissues and at higher levels in salivary gland, stomach, and kidney. By in situ hybridization of chick and mouse embryos, Grun et al. (2000) demonstrated expression of Aldh1a3 in the developing sensory neuroepithelia of the eye, nose, and ear, and in discreet sites within the central nervous system. Expression of chick Aldh1a3 in a human choriocarcinoma cell line conferred increased sensitivity to retinol in a retinoic acid receptor (see OMIM Ref. No. 180240)- dependent reporter assay. GENE STRUCTURE Hsu et al. (1994) determined that the ALDH6 gene spans about 37 kb and contains 13 exons. Putative TATA and CCAAT boxes and Sp1 binding sites were found in the 5- prime upstream region of the gene.

[16141]

[16142] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16143] Grun, F.; Hirose, Y.; Kawauchi, S.; Ogura, T.; Umesono, K. : Aldehyde dehydrogenase 6, a cytosolic retinaldehyde dehydrogenase prominently expressed in sensory neuroepithelia during development. J. Biol. Chem. 275: 41210-41218, 2000. ; and

[16144] Hsu, L. C.; Chang, W.- C.; Hiraoka, L.; Hsieh, C.- L. : Molecular cloning, genomic organization, and chromosomal localization of an additional human aldehyde dehydrogenase gene, ALDH6. G.

[16145] Further studies establishing the function and utilities of ALDH1A3 are found in John Hopkins OMIM database record ID 600463, and in cited publications listed in Table 5, which are hereby incorporated by reference.ALEX3 (Accession NP_057691.1) is another GAM96 target gene, herein designated TARGET GENE. ALEX3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ALEX3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALEX3 BINDING SITE, designated SEQ ID:13767, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16146] Another function of GAM96 is therefore inhibition of ALEX3 (Accession NP_057691.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALEX3.

[16147] ALEX3 (Accession NP_808817.1) is another GAM96 target

gene, herein designated TARGET GENE. ALEX3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ALEX3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALEX3 BINDING SITE, designated SEQ ID:13767, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16148] Another function of GAM96 is therefore inhibition of ALEX3 (Accession NP_808817.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALEX3.

[16149] ALEX3 (Accession NP_808816.1) is another GAM96 target gene, herein designated TARGET GENE. ALEX3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ALEX3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALEX3 BINDING SITE, designated SEQ ID:13767, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16150] Another function of GAM96 is therefore inhibition of ALEX3 (Accession NP_808816.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALEX3.

[16151] Rho guanine nucleotide exchange factor (gef) 15 (ARHGEF15, Accession NP_055773.1) is another GAM96 target gene, herein designated TARGET GENE. ARHGEF15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ARHGEF15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGEF15 BINDING SITE, designated SEQ ID:10259, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16152] Another function of GAM96 is therefore inhibition of Rho guanine nucleotide exchange factor (gef) 15 (ARHGEF15, Accession NP_055773.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF15.

[16153] Rho guanine nucleotide exchange factor (gef) 15 (ARHGEF15, Accession NP_776089.1) is another GAM96

target gene, herein designated TARGET GENE. ARHGEF15 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ARHGEF15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGEF15 BINDING SITE, designated SEQ ID:10259, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16154] Another function of GAM96 is therefore inhibition of Rho guanine nucleotide exchange factor (gef) 15 (ARHGEF15, Accession NP_776089.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF15.

[16155] ARK5 (Accession NP_055655.1) is another GAM96 target gene, herein designated TARGET GENE. ARK5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARK5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARK5 BINDING SITE, designated SEQ ID:16825, to the nucleotide se-

quence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16156] Another function of GAM96 is therefore inhibition of ARK5 (Accession NP_055655.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARK5.

[16157] ASH1 (Accession NP_060959.1) is another GAM96 target gene, herein designated TARGET GENE. ASH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ASH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASH1 BINDING SITE, designated SEQ ID:16309, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16158] Another function of GAM96 is therefore inhibition of ASH1 (Accession NP_060959.1), a gene which is a candidate regulator of development in the mammalian central nervous system and neural crest. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASH1.

[16159] The function of ASH1 has been established by previous

studies. Using retroviral labeling in organotypic slice cultures of the embryonic human forebrain, Letinic et al. (2002) demonstrated the existence of 2 distinct lineages of neocortical GABAergic neurons. One lineage expresses DLX1 (OMIM Ref. No. 600029) and DLX2 (OMIM Ref. No. 126255) and MASH1 transcription factors, represents 65% of neocortical GABAergic neurons in humans, and originates from MASH1- expressing progenitors of the neocortical ventricular and subventricular zone of the dorsal forebrain. The second lineage, characterized by the expression of DLX1 and DLX2 but not MASH1, forms around 35% of the GABAergic neurons and originates from the ganglionic eminence of the ventral forebrain. Letinic et al. (2002) suggested that modifications in the expression pattern of transcription factors in the forebrain may underlie species- specific programs for the generation of neocortical local circuit neurons and that distinct lineages of cortical interneurons may be differentially affected in genetic and acquired diseases of the human brain

[16160] Animal model experiments lend further support to the function of ASH1. By homologous recombination in embryonic stem cells, Guillemot et al. (1993) created a null allele of the Mash1 gene. Homozygous mice died at birth

with apparent breathing and feeding defects. The brain and spinal cord appeared normal, but the olfactory epithelium and sympathetic, parasympathetic, and enteric ganglia were severely affected. These observations suggested that the Mash1 gene, like its Drosophila homologs, controls a basic operation in development of neuronal progenitors in distinct neural lineages

[16161] It is appreciated that the abovementioned animal model for ASH1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[16162] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16163] Letinic, K.; Zoncu, R.; Rakic, P. : Origin of GABAergic neurons in the human neocortex. Nature 417: 645- 649, 2002. ; and

[16164] Guillemot, F.; Lo, L.- C.; Johnson, J. E.; Auerbach, A.; Anderson, D. J.; Joyner, A. L. : Mammalian achaete- scute homolog 1 is required for the early development of olfactory and autonom.

[16165] Further studies establishing the function and utilities of ASH1 are found in John Hopkins OMIM database record ID

100790, and in cited publications listed in Table 5, which are hereby incorporated by reference.Btb and cnc homology 1, basic leucine zipper transcription factor 2 (BACH2, Accession NP_068585.1) is another GAM96 target gene, herein designated TARGET GENE. BACH2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BACH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACH2 BINDING SITE, designated SEQ ID:13426, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16166] Another function of GAM96 is therefore inhibition of Btb and cnc homology 1, basic leucine zipper transcription factor 2 (BACH2, Accession NP_068585.1), a gene which acts as repressor or activator, binds to maf recognition elements and therefore may be associated with Non-hodgkin lymphoma. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of Non-hodgkin lymphoma, and of other diseases and clinical conditions associated with BACH2.

[16167] The function of BACH2 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Bone gamma-carboxyglutamate (gla) protein (osteocalcin) (BGLAP, Accession NP_000702.1) is another GAM96 target gene, herein designated TARGET GENE. BGLAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BGLAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BGLAP BINDING SITE, designated SEQ ID:17362, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16168] Another function of GAM96 is therefore inhibition of Bone gamma-carboxyglutamate (gla) protein (osteocalcin) (BGLAP, Accession NP_000702.1), a gene which associates with the mineralized matrix of bone. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BGLAP.

[16169] The function of BGLAP has been established by previous studies. Bone gamma- carboxyglutamic acid (Gla) protein (BGLAP, or BGP) is a small, highly conserved molecule associated with the mineralized matrix of bone. Its interac-

tion with synthetic hydroxyapatite in vitro is absolutely dependent on its content of 3 residues of gamma- carboxyglutamic acid, the amino acid formed posttranslationally from glutamic acid by a vitamin K- dependent process. Celeste et al. (1986) used mouse and rat cDNA clones to isolate the human BGP gene. It has 4 exons. Comparison of the exon structure of the BGP gene and the factor IX gene (OMIM Ref. No. 306900), which is a gamma- carboxylated clotting factor, suggested that the exons encoding the part of the leader peptides presumably directing gamma- carboxylation arose from a common ancestral sequence. Kerner et al. (1989) described regions within the BGP promoter that contribute to basal expression of the osteocalcin gene in osteoblast- like cells in culture. Further, they defined a 21- basepair element that acts in cis to mediate vitamin D inducibility of the osteocalcin gene.

[16170]

[16171] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16172] Celeste, A. J.; Rosen, V.; Buecker, J. L.; Kriz, R.; Wang, E. A.; Wozney, J. M. : Isolation of the human gene for bone

gla protein utilizing mouse and rat cDNA clones. EMBO J. 5: 1885- 1890, 1986. ; and

[16173] Kerner, S. A.; Scott, R. A.; Pike, J. W. : Sequence elements in the human osteocalcin gene confer basal activation and inducible response to hormonal vitamin D(3). Proc. Nat. Acad. Sci.

[16174] Further studies establishing the function and utilities of BGLAP are found in John Hopkins OMIM database record ID 112260, and in cited publications listed in Table 5, which are hereby incorporated by reference.C14orf132 (Accession NP_064600.1) is another GAM96 target gene, herein designated TARGET GENE. C14orf132 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf132, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf132 BINDING SITE, designated SEQ ID:691, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16175] Another function of GAM96 is therefore inhibition of C14orf132 (Accession NP_064600.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with C14orf132.

[16176] C14orf140 (Accession NP_078919.1) is another GAM96 target gene, herein designated TARGET GENE. C14orf140 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf140, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf140 BINDING SITE, designated SEQ ID:20031, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16177] Another function of GAM96 is therefore inhibition of C14orf140 (Accession NP_078919.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf140.

[16178] C4orf9 (Accession XP_035572.1) is another GAM96 target gene, herein designated TARGET GENE. C4orf9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C4orf9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of C4orf9 BINDING SITE, designated SEQ ID:4126, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16179] Another function of GAM96 is therefore inhibition of C4orf9 (Accession XP_035572.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C4orf9.

[16180] Chromosome 6 open reading frame 31 (C6orf31, Accession NP_085154.2) is another GAM96 target gene, herein designated TARGET GENE. C6orf31 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf31, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf31 BINDING SITE, designated SEQ ID:17451, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16181] Another function of GAM96 is therefore inhibition of Chromosome 6 open reading frame 31 (C6orf31, Accession NP_085154.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with C6orf31.

[16182] Chromosome 7 open reading frame 10 (C7orf10, Accession NP_079004.1) is another GAM96 target gene, herein designated TARGET GENE. C7orf10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C7orf10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C7orf10 BINDING SITE, designated SEQ ID:11807, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16183] Another function of GAM96 is therefore inhibition of Chromosome 7 open reading frame 10 (C7orf10, Accession NP_079004.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C7orf10.

[16184] Ca2+-dependent activator protein for secretion (CADPS, Accession NP_003707.1) is another GAM96 target gene, herein designated TARGET GENE. CADPS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CADPS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CADPS BINDING SITE, designated SEQ ID:11125, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16185] Another function of GAM96 is therefore inhibition of Ca2+-dependent activator protein for secretion (CADPS, Accession NP_003707.1), a gene which is required for the Ca2+- regulated exocytosis of secretory vesicles. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CADPS.

[16186] The function of CADPS has been established by previous studies. Calcium- activated secretion in neuroendocrine cells is dependent on ATP and cytosolic proteins such as NSF (OMIM Ref. No. 601633), SNAPs (see OMIM Ref. No. 603215) GTP- binding proteins, and components of a vesicle coat complex. Walent et al. (1992) isolated a rat cytosolic factor, which they termed p145, that reconstitutes Ca(2+)- activated secretion via dense core vesicle exocytosis in permeable neuroendocrine cells. The protein is a dimer of 145- kD subunits. By screening rat brain cDNA libraries with anti- p145, Ann et al. (1997) obtained

a cDNA encoding a protein of 1,289 amino acids, which they designated CAPS. Sequence analysis revealed an overall hydrophilic protein with 2 potential coiled- coil regions. Northern blot analysis on mRNA from human tissue revealed expression of a 5.6- kb transcript in brain, pancreas, hypothalamus, pituitary, and adrenal, but not in heart, placenta, lung, liver, skeletal muscle, or kidney. The sequence of rat CAPS is 75% similar and 54% identical to that of C. elegans UNC31; loss- of- function UNC31 mutants exhibit multiple nervous system defects. Equilibrium dialysis studies showed that CAPS is a calcium- binding protein. By subcellular fractionation of isolated rat presynaptic nerve terminals, or synaptosomes, Berwin et al. (1998) determined that CAPS is primarily associated with plasma membranes and large dense core vesicles but not with small clear synaptic vesicles.

[16187]

[16188] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16189] Walent, J. H.; Porter, B. W.; Martin, T. F. J. : A novel 145 kd brain cytosolic protein reconstitutes Ca(2+)- regulated secretion in permeable neuroendocrine cells. Cell 70:

765- 775, 1992. ; and

[16190] Ann, K.; Kowalchyk, J. A.; Loyet, K. M.; Martin, T. F. J. : Novel Ca(2+)- binding protein (CAPS) related to UNC- 31 required for Ca(2+)- activated exocytosis. J. Biol. Chem. 272: 19637- 1964.

[16191] Further studies establishing the function and utilities of CADPS are found in John Hopkins OMIM database record ID 604667, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cd209 antigen (CD209, Accession NP_066978.1) is another GAM96 target gene, herein designated TARGET GENE. CD209 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CD209, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD209 BINDING SITE, designated SEQ ID:18162, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16192] Another function of GAM96 is therefore inhibition of Cd209 antigen (CD209, Accession NP_066978.1), a gene which may play an important role in the CD4- independent association of HIV with cells. Accordingly, utilities of

GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD209.

[16193] The function of CD209 has been established by previous studies. DCs capture microorganisms that enter peripheral mucosal tissues, and then migrate to secondary lymphoid organs, where they present these in antigenic form to resting T cells, thus initiating adaptive immune responses. Geijtenbeek et al. (2000) described the properties of DC-SIGN, which is highly expressed on DCs present in mucosal tissues and binds to the HIV- 1 envelope glycoprotein gp120. DCSIGN does not function as a receptor for viral entry into DCs but instead promotes efficient infection in trans of cells that express CD4 and chemokine receptors. Geijtenbeek et al. (2000) proposed that DCSIGN efficiently captures HIV- 1 in the periphery and facilitates its transport to secondary lymphoid organs rich in T cells, to enhance infection in trans of these target cells. The binding of the human immunodeficiency virus (HIV) envelope glycoprotein gp120 to the cell surface receptor CD4 (OMIM Ref. No. 186940) had been considered a primary determinant of viral tropism. A number of cell types, however, can be infected by the virus, or bind gp120, in the absence of CD4 expression. Human placenta had been

identified as a tissue that binds gp120 in a CD4- independent manner. By expression cloning, Curtis et al. (1992) screened a placenta cDNA library and isolated a cDNA (clone 11) encoding a gp120- binding protein unrelated to CD4. The 1.3- kb cDNA predicts a 404- amino acid protein with a calculated molecular mass of 45,775 Da. The gp120- binding protein is organized into 3 domains: an N- terminal cytoplasmic and hydrophobic region, a set of tandem repeats (7 complete and 1 incomplete), and a C- terminal domain with homology to C- type (calcium- dependent) lectins. A type II membrane orientation (N- terminal cytoplasmic) was predicted both by the cDNA sequence and by the reactivity of C- terminal peptide- specific antiserum with the surface of clone 11- transfected cells. Native and recombinant gp120 and whole virus bound transfected cells. Gp120 binding was high affinity (Kd, 1.3 to 1.6 nM) and was inhibited by mannan, D- mannose, and L- fucose; once bound, gp120 was internalized rapidly. These data demonstrated that the gp120- binding protein is a membrane- associated mannose- binding lectin. Curtis et al. (1992) suggested that proteins of this type may play an important role in the CD4- independent association of HIV with cells.

[16194]

[16195] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16196] Geijtenbeek, T. B. H.; Kwon, D. S.; Torensma, R.; van Vliet, S. J.; van Duijnhoven, G. C. F.; Middel, J.; Cornelissen, I. L. M. H. A.; Nottet, H. S. L. M.; KewalRamani, V. N.; Littman, D. R.; Figdor, C. G.; van Kooyk, Y. : DC- SIGN, a dendritic cell- specific HIV- 1- binding protein that enhances trans- infection of T cells. Cell 100: 587- 597, 2000. ; and

[16197] Curtis, B. M.; Scharnowske, S.; Watson, A. J. : Sequence and expression of a membrane- associated C- type lectin that exhibits CD4- independent binding of human im- munodeficiency virus enve.

[16198] Further studies establishing the function and utilities of CD209 are found in John Hopkins OMIM database record ID 604672, and in cited publications listed in Table 5, which are hereby incorporated by reference.Choline ki- nase-like (CHKL, Accession NP_689466.1) is another GAM96 target gene, herein designated TARGET GENE. CHKL BINDING SITE1 and CHKL BINDING SITE2 are target binding sites found in untranslated regions of multiple

transcripts of mRNA encoded by CHKL, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHKL BINDING SITE1 and CHKL BINDING SITE2, designated SEQ ID:13794 and SEQ ID:8093 respectively, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16199] Another function of GAM96 is therefore inhibition of Choline kinase-like (CHKL, Accession NP_689466.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHKL.

[16200] Chloride channel, nucleotide-sensitive, 1a (CLNS1A, Accession NP_001284.1) is another GAM96 target gene, herein designated TARGET GENE. CLNS1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLNS1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLNS1A BINDING SITE, designated SEQ ID:3510, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:394.

[16201] Another function of GAM96 is therefore inhibition of Chloride channel, nucleotide-sensitive, 1a (CLNS1A, Accession NP_001284.1), a gene which may participate in cellular volume control . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLNS1A.

[16202] The function of CLNS1A has been established by previous studies. Anguita et al. (1995) cloned a novel gene encoding the chloride channel I(Cln) from a human ocular ciliary epithelial cell cDNA library. The gene encodes a 237-amino acid polypeptide that is over 90% identical to rat and canine I(Cln). The predicted protein contains 4 putative transmembrane domains. By Northern blot analysis, Nagl et al. (1996) found that the gene is expressed as an approximately 1.7- kb message in a variety of human tissues. Nagl et al. (1996) cloned the genomic DNA of the CLNS1A gene and showed that the gene comprises several exons spanning 19 kb of the genome. Schwartz et al. (1997) cloned I(Cln) from human reticulocyte cDNA. I(Cln) protein from red blood cell ghost membranes migrated as 2 bands, 37 and 43 kD, on SDS- PAGE. Schwartz et al. (1997) immunolocalized I(Cln) to the red blood cell mem-

brane and, by the yeast 2- hybrid system, demonstrated that it formed stable complexes with beta- actin (OMIM Ref. No. 102630). The authors suggested that I(Cln) is involved in chloride transport and volume regulation in red blood cells.

[16203]

[16204] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16205] Anguita, J.; Chalfant, M. L.; Civan, M. M.; Coca- Prados, M. : Molecular cloning of the human volume- sensitive chloride conductance regulatory protein, pI(Cln), from ocular ciliary epithelium. Biochem. Biophys. Res. Commun. 208: 89- 95, 1995. ; and

[16207] Further studies establishing the function and utilities of CLNS1A are found in John Hopkins OMIM database record ID 602158, and in cited publications listed in Table 5, which are hereby incorporated by reference.Collagen, type xi, alpha 2 (COL11A2, Accession NP_542412.1) is another

GAM96 target gene, herein designated TARGET GENE. COL11A2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by COL11A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL11A2 BINDING SITE, designated SEQ ID:6777, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16208] Another function of GAM96 is therefore inhibition of Collagen, type xi, alpha 2 (COL11A2, Accession NP_542412.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL11A2.

[16209] Collagen, type xi, alpha 2 (COL11A2, Accession NP_542410.1) is another GAM96 target gene, herein designated TARGET GENE. COL11A2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by COL11A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

COL11A2 BINDING SITE, designated SEQ ID:6777, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16210] Another function of GAM96 is therefore inhibition of Collagen, type xi, alpha 2 (COL11A2, Accession NP_542410.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL11A2.

[16211] Collagen, type xi, alpha 2 (COL11A2, Accession NP_542411.1) is another GAM96 target gene, herein designated TARGET GENE. COL11A2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by COL11A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL11A2 BINDING SITE, designated SEQ ID:6777, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16212] Another function of GAM96 is therefore inhibition of Collagen, type xi, alpha 2 (COL11A2, Accession NP_542411.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with COL11A2.

[16213] Carnitine palmitoyltransferase 1b (muscle) (CPT1B, Accession NP_689452.1) is another GAM96 target gene, herein designated TARGET GENE. CPT1B BINDING SITE1 and CPT1B BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CPT1B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPT1B BINDING SITE1 and CPT1B BINDING SITE2, designated SEQ ID:13794 and SEQ ID:8093 respectively, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16214] Another function of GAM96 is therefore inhibition of Carnitine palmitoyltransferase 1b (muscle) (CPT1B, Accession NP_689452.1), a gene which is a rate- controlling enzyme of long- chain fatty acid b- oxidation pathway. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPT1B.

[16215] The function of CPT1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM47.1.Carnitine palmitoyltransferase 1b (muscle) (CPT1B, Accession NP_004368.1) is another GAM96 target gene, herein designated TARGET GENE. CPT1B BINDING SITE1 and CPT1B BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CPT1B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPT1B BINDING SITE1 and CPT1B BINDING SITE2, designated SEQ ID:13794 and SEQ ID:13794 respectively, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16216] Another function of GAM96 is therefore inhibition of Carnitine palmitoyltransferase 1b (muscle) (CPT1B, Accession NP_004368.1), a gene which is a rate- controlling enzyme of long- chain fatty acid b- oxidation pathway. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPT1B.

[16217] The function of CPT1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM47.1.Carnitine palmitoyltransferase 1b (muscle) (CPT1B, Accession NP_689451.1) is another GAM96 target gene, herein designated TARGET GENE. CPT1B BINDING SITE1 and CPT1B BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CPT1B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPT1B BINDING SITE1 and CPT1B BINDING SITE2, designated SEQ ID:13794 and SEQ ID:15756 respectively, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16218] Another function of GAM96 is therefore inhibition of Carnitine palmitoyltransferase 1b (muscle) (CPT1B, Accession NP_689451.1), a gene which is a rate- controlling enzyme of long- chain fatty acid b- oxidation pathway. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPT1B.

[16219] The function of CPT1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM47.1.Cytochrome p450, subfamily iia (phenobarbital-inducible), polypeptide 7 (CYP2A7, Accession NP_000755.2) is another GAM96 target gene, herein designated TARGET GENE. CYP2A7 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CYP2A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP2A7 BINDING SITE, designated SEQ ID:15756, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16220] Another function of GAM96 is therefore inhibition of Cytochrome p450, subfamily iia (phenobarbital-inducible), polypeptide 7 (CYP2A7, Accession NP_000755.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP2A7.

[16221] Death-associated protein kinase 2 (DAPK2, Accession NP_055141.2) is another GAM96 target gene, herein designated TARGET GENE. DAPK2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DAPK2, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DAPK2 BINDING SITE, designated SEQ ID:17977, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16222] Another function of GAM96 is therefore inhibition of Death-associated protein kinase 2 (DAPK2, Accession NP_055141.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPK2.

[16223] Dihydrofolate reductase (DHFR, Accession NP_000782.1) is another GAM96 target gene, herein designated TARGET GENE. DHFR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHFR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DHFR BINDING SITE, designated SEQ ID:4871, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16224] Another function of GAM96 is therefore inhibition of Dihydrofolate reductase (DHFR, Accession NP_000782.1), a gene which converts dihydrofolate into tetrahydrofolate.

Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHFR.

[16225] The function of DHFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM64.1.DIS3 (Accession NP_055768.2) is another GAM96 target gene, herein designated TARGET GENE. DIS3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DIS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DIS3 BINDING SITE, designated SEQ ID:16298, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16226] Another function of GAM96 is therefore inhibition of DIS3 (Accession NP_055768.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIS3.

[16227] DKFZP434B204 (Accession XP_300993.1) is another GAM96 target gene, herein designated TARGET GENE. DKFZP434B204 BINDING SITE is a target binding site found in

the 5` untranslated region of mRNA encoded by DKFZP434B204, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434B204 BINDING SITE, designated SEQ ID:19187, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16228] Another function of GAM96 is therefore inhibition of DKFZP434B204 (Accession XP_300993.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B204.

[16229] DKFZp434C1714 (Accession NP_690047.1) is another GAM96 target gene, herein designated TARGET GENE. DKFZp434C1714 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434C1714, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434C1714 BINDING SITE, designated SEQ ID:10751, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated

SEQ ID:394.

[16230] Another function of GAM96 is therefore inhibition of DKFZp434C1714 (Accession NP_690047.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C1714.

[16231] DKFZP434G1411 (Accession XP_166383.1) is another GAM96 target gene, herein designated TARGET GENE. DKFZP434G1411 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP434G1411, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434G1411 BINDING SITE, designated SEQ ID:7012, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16232] Another function of GAM96 is therefore inhibition of DKFZP434G1411 (Accession XP_166383.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434G1411.

[16233] DKFZP434H0820 (Accession NP_073744.1) is another

GAM96 target gene, herein designated TARGET GENE. DKFZP434H0820 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434H0820, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434H0820 BINDING SITE, designated SEQ ID:16671, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16234] Another function of GAM96 is therefore inhibition of DKFZP434H0820 (Accession NP_073744.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H0820.

[16235] DKFZP434J154 (Accession NP_056425.1) is another GAM96 target gene, herein designated TARGET GENE. DKFZP434J154 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DKFZP434J154, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434J154

BINDING SITE, designated SEQ ID:1790, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16236] Another function of GAM96 is therefore inhibition of DKFZP434J154 (Accession NP_056425.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J154.

[16237] DKFZP564K2062 (Accession NP_056236.1) is another GAM96 target gene, herein designated TARGET GENE. DKFZP564K2062 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564K2062, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564K2062 BINDING SITE, designated SEQ ID:15475, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16238] Another function of GAM96 is therefore inhibition of DKFZP564K2062 (Accession NP_056236.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP564K2062.

[16239] DKFZp586I1420 (Accession NP_689960.1) is another GAM96 target gene, herein designated TARGET GENE. DKFZp586I1420 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp586I1420, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp586I1420 BINDING SITE, designated SEQ ID:13013, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16240] Another function of GAM96 is therefore inhibition of DKFZp586I1420 (Accession NP_689960.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586I1420.

[16241] DKFZP586I2223 (Accession NP_056253.2) is another GAM96 target gene, herein designated TARGET GENE. DKFZP586I2223 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DKFZP586I2223, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586I2223 BINDING SITE, designated SEQ ID:13101, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16242] Another function of GAM96 is therefore inhibition of DKFZP586I2223 (Accession NP_056253.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586I2223.

[16243] DKFZP586I2223 (Accession NP_542768.1) is another GAM96 target gene, herein designated TARGET GENE. DKFZP586I2223 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DKFZP586I2223, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586I2223 BINDING SITE, designated SEQ ID:13101, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16244] Another function of GAM96 is therefore inhibition of DKFZP586I2223 (Accession NP_542768.1) . Accordingly, util-

ities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586I2223.

[16245] DKFZP586I2223 (Accession NP_542769.1) is another GAM96 target gene, herein designated TARGET GENE. DKFZP586I2223 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DKFZP586I2223, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586I2223 BINDING SITE, designated SEQ ID:13101, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16246] Another function of GAM96 is therefore inhibition of DKFZP586I2223 (Accession NP_542769.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586I2223.

[16247] DKFZp761A132 (Accession NP_115672.1) is another GAM96 target gene, herein designated TARGET GENE. DKFZp761A132 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DK-

FZp761A132, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761A132 BINDING SITE, designated SEQ ID:9980, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16248] Another function of GAM96 is therefore inhibition of DKFZp761A132 (Accession NP_115672.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761A132.

[16249] DKFZp761B107 (Accession NP_775734.1) is another GAM96 target gene, herein designated TARGET GENE. DKFZp761B107 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761B107, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761B107 BINDING SITE, designated SEQ ID:2288, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16250] Another function of GAM96 is therefore inhibition of DKFZp761B107 (Accession NP_775734.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B107.

[16251] DKFZp761I2123 (Accession XP_166582.2) is another GAM96 target gene, herein designated TARGET GENE. DKFZp761I2123 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761I2123, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761I2123 BINDING SITE, designated SEQ ID:16727, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16252] Another function of GAM96 is therefore inhibition of DKFZp761I2123 (Accession XP_166582.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761I2123.

[16253] Down syndrome critical region gene 1 (DSCR1, Accession NP_004405.2) is another GAM96 target gene, herein des-

ignated TARGET GENE. DSCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DSCR1 BINDING SITE, designated SEQ ID:5007, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16254] Another function of GAM96 is therefore inhibition of Down syndrome critical region gene 1 (DSCR1, Accession NP_004405.2), a gene which inhibits calcineurin- dependent transcriptional responses. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR1.

[16255] The function of DSCR1 has been established by previous studies. The study of patients with partial trisomy 21 has defined an area of approximately 3 Mb at chromosomal region 21q22 as the minimal candidate region for the Down syndrome phenotype (OMIM Ref. No. 190685). Using a novel exon cloning strategy, Fuentes et al. (1995) identified several putative exons from region 21q22.1-q22.2. One exon was used to isolate fetal brain cDNAs corresponding to a gene that the authors designated

DSCR1. The predicted 171- amino acid protein contains 2 proline- rich regions, a putative DNA- binding domain, and an acidic region. Northern blot analysis revealed that the 2.2- kb DSCR1 transcript is expressed at the highest levels in fetal brain and adult heart and at lower levels in various other tissues. An additional 2- kb mRNA was detected in fetal and adult liver. Increased expression in the brains of young rats compared with adults suggested to Fuentes et al. (1995) that DSCR1 plays a role during central nervous system development. Fuentes et al. (1997) determined that DSCR1 spans nearly 45 kb and contains 7 exons, 4 of which are alternative first exons. They found tissue- specific expression patterns for the alternative transcripts. Kingsbury and Cunningham (2000) referred to the proteins encoded by the MCIP genes as calcipressins. Functional analysis showed that when expressed in yeast, DSCR1 and ZAKI4 inhibited calcineurin function. The authors proposed that increased expression of DSCR1 in trisomy- 21 individuals may contribute to the neurologic, cardiac, or immunologic defects of Down syndrome.

[16256]

[16257] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[16258] Fuentes, J. J.; Pritchard, M. A.; Estivill, X. : Genomic organization, alternative splicing, and expression patterns of the DSCR1 (Down syndrome candidate region 1) gene. Genomics 44: 358- 361, 1997. ; and

[16259] Kingsbury, T. J.; Cunningham, K. W. : A conserved family of calcineurin regulators. Genes Dev. 14: 1595- 1604, 2000.

[16260] Further studies establishing the function and utilities of DSCR1 are found in John Hopkins OMIM database record ID 602917, and in cited publications listed in Table 5, which are hereby incorporated by reference.DUSP18 (Accession NP_689724.2) is another GAM96 target gene, herein designated TARGET GENE. DUSP18 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DUSP18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DUSP18 BINDING SITE, designated SEQ ID:14263, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16261] Another function of GAM96 is therefore inhibition of

DUSP18 (Accession NP_689724.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP18.

[16262] Eukaryotic translation initiation factor 2, subunit 1 alpha, 35kda (EIF2S1, Accession NP_004085.1) is another GAM96 target gene, herein designated TARGET GENE. EIF2S1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EIF2S1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EIF2S1 BINDING SITE, designated SEQ ID:15812, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16263] Another function of GAM96 is therefore inhibition of Eukaryotic translation initiation factor 2, subunit 1 alpha, 35kda (EIF2S1, Accession NP_004085.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2S1.

[16264] Ectonucleoside triphosphate diphosphohydrolase 3 (ENTPD3, Accession NP_001239.1) is another GAM96 target gene, herein designated TARGET GENE. ENTPD3 BIND-

ING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ENTPD3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ENTPD3 BINDING SITE, designated SEQ ID:1288, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16265] Another function of GAM96 is therefore inhibition of Ectonucleoside triphosphate diphosphohydrolase 3 (ENTPD3, Accession NP_001239.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENTPD3.

[16266] EPAC (Accession NP_006096.2) is another GAM96 target gene, herein designated TARGET GENE. EPAC BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by EPAC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPAC BINDING SITE, designated SEQ ID:3791, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16267] Another function of GAM96 is therefore inhibition of EPAC (Accession NP_006096.2), a gene which activates the ras family member Rap1 by promoting GTP binding. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPAC.

[16268] The function of EPAC has been established by previous studies. cAMP is a second messenger that induces a wide range of responses in different cell types, including activation of the RAS- related GTPase RAP1A (OMIM Ref. No. 179520). By searching databases for proteins with cAMP-binding sites and homology to guanine nucleotide exchange factors (GEFs) for RAS (OMIM Ref. No. 190020) and RAP1, followed by RT- PCR, de Rooij et al. (1998) isolated a cDNA encoding EPAC. Sequence analysis predicted that the 881- amino acid EPAC protein has a cAMP- binding site; a GEF homology domain; a RAS exchange motif, which may be important in GEF structure stabilization; and a DEP (dishevelled, egl10, pleckstrin) domain, which may be involved in membrane attachment. Northern blot analysis revealed ubiquitous expression of EPAC, with highest levels in kidney and heart. Binding analysis confirmed a direct interaction between EPAC and cAMP. Functional

analysis showed that EPAC is a GEF for RAP1A that is directly regulated by cAMP. Using differential display for brain- enriched genes related to signaling in striatum, and by screening for second messenger motifs, Kawasaki et al. (1998) obtained cDNAs encoding EPAC, which they called cAMP- GEFI, and cAMP- GEFII (OMIM Ref. No. 606058). Expression of cAMP- GEFI and cAMP- GEFII activated RAP1A after forskolin and 3- isobutyl- 1- methylxanthine stimulation, independent of the protein kinase A (see OMIM Ref. No. 176911) pathway. cAMP- GEFI and cAMP- GEFII expression did not activate or only slightly activated other RAS superfamily members after stimulation. Mutational analysis determined that the cAMP- binding site of cAMP- GEFI is necessary for activation of RAP1A. Northern blot analysis detected wide expression of a predominant 4.0- kb cAMP- GEFI transcript in various tissues and brain regions. In situ hybridization analysis demonstrated broad, low- level expression of cAMP- GEFI in adult rat brain and selective expression in neonatal brain, including septum and thalamus.

[16273] Further studies establishing the function and utilities of EPAC are found in John Hopkins OMIM database record ID 606057, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ephb1 (EPHB1, Accession NP_004432.1) is another GAM96 target gene, herein designated TARGET GENE. EPHB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EPHB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EPHB1 BINDING SITE, designated SEQ ID:9482, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16274] Another function of GAM96 is therefore inhibition of Ephb1 (EPHB1, Accession NP_004432.1), a gene which receptor for members of the ephrin- b family. binds to ephrin- b1, - b2 and - b3. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB1.

[16275] The function of EPHB1 has been established by previous studies. See 179610 for background on Eph receptors and their ligands, the ephrins.Tang et al. (1995) cloned and characterized a member of the EPH- related receptor protein tyrosine kinases and designated it NET (neuronally expressed EPH- related tyrosine kinase). The cDNA was isolated from a fetal brain expression library using a monoclonal antibody. The 3.9- kb RNA encodes a predicted protein of 984 amino acids with 2 hydrophobic regions corresponding to possible signal peptide and transmembrane domains. The NET protein shares 99% amino acid identity with Elk, the rat homolog. Northern blots showed maximal NET expression in the nervous system and in some tumor cell lines derived from neuroectoderm. Using immunohistochemical analysis of the developing mouse hindbrain, Cowan et al. (2000) detected Ephb1 expression in the floor plate and in hindbrain regions where

facial and inner ear efferent neurons are located. Contractor et al. (2002) reported that mossy fiber long- term potentiation was reduced by perfusion of postsynaptic neurons with peptides and antibodies that interfere with binding of EphB receptor tyrosine kinases to the PDZ protein GRIP (GRIP1; 604597). Mossy fiber long- term potentiation was also reduced by extracellular application of soluble forms of beta- ephrins, which are normally membrane- anchored presynaptic ligands for the EphB receptors. The application of soluble ligands for presynaptic ephrins increased basal excitatory transmission and occluded both tetanus and forskolin- induced synaptic potentiation. Contractor et al. (2002) concluded that the PDZ interactions in postsynaptic neuron and transsynaptic interactions between postsynaptic EphB receptors and presynaptic beta- ephrins are necessary for the induction of mossy fiber long- term potentiation. Tang et al. (1995) mapped the EPHB1 gene to 3q21- q23 by fluorescence in situ hybridization.

[16276]

[16277] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16280] Further studies establishing the function and utilities of EPHB1 are found in John Hopkins OMIM database record ID 600600, and in cited publications listed in Table 5, which are hereby incorporated by reference.Era g-protein-like 1 (e. coli) (ERAL1, Accession NP_005693.1) is another GAM96 target gene, herein designated TARGET GENE. ERAL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ERAL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ERAL1 BINDING SITE, designated SEQ ID:18451, to the nucleotide sequence of GAM96 RNA,

herein designated GAM RNA, also designated SEQ ID:394.

[16281] Another function of GAM96 is therefore inhibition of Era g-protein-like 1 (e. coli) (ERAL1, Accession NP_005693.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERAL1.

[16282] Coagulation factor xiii, a1 polypeptide (F13A1, Accession NP_000120.1) is another GAM96 target gene, herein designated TARGET GENE. F13A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by F13A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F13A1 BINDING SITE, designated SEQ ID:5986, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16283] Another function of GAM96 is therefore inhibition of Coagulation factor xiii, a1 polypeptide (F13A1, Accession NP_000120.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F13A1.

[16284] Coagulation factor ix (plasma thromboplastic component, christmas disease, hemophilia b) (F9, Accession

NP_000124.1) is another GAM96 target gene, herein designated TARGET GENE. F9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by F9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F9 BINDING SITE, designated SEQ ID:946, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16285] Another function of GAM96 is therefore inhibition of Coagulation factor ix (plasma thromboplastic component, christmas disease, hemophilia b) (F9, Accession NP_000124.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F9.

[16286] F-box only protein 22 (FBXO22, Accession NP_671717.1) is another GAM96 target gene, herein designated TARGET GENE. FBXO22 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXO22, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXO22 BINDING

SITE, designated SEQ ID:9917, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16287] Another function of GAM96 is therefore inhibition of F-box only protein 22 (FBXO22, Accession NP_671717.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO22.

[16288] Fetuin b (FETUB, Accession NP_055190.1) is another GAM96 target gene, herein designated TARGET GENE. FETUB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FETUB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FETUB BINDING SITE, designated SEQ ID:5702, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16289] Another function of GAM96 is therefore inhibition of Fetuin b (FETUB, Accession NP_055190.1), a gene which Member of the cystatin family of cysteine protease inhibitors. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with FETUB.

[16290] The function of FETUB has been established by previous studies. The fetuin family, which is part of the cystatin superfamily, encompasses a series of tightly related proteins that are synthesized mostly in the liver. Fetuins have been implicated in several diverse functions, including osteogenesis and bone resorption, regulation of the insulin and hepatocyte growth factor receptors (147670 and 164860, respectively), and response to systemic inflammation. In an effort to identify hepatic genes preferentially expressed during acute inflammation, Olivier et al. (1999) identified a partial cDNA encoding rat fetuin B (Fetub). Northern blot analysis detected liver- specific expression of rat Fetub. By searching an EST database using the full- length rat sequence as the probe, Olivier et al. (2000) identified cDNAs encoding human and mouse FETUB. The 382- amino acid human FETUB protein shares sequence and structural similarity with fetuin A (FETUA; 138680). The human, mouse, and rat FETUB proteins share 61% amino acid identity. Northern blot analysis detected a developmentally regulated expression pattern for Fetub in mouse and rat liver that differed between species. In response to inflammatory stimulus, hepatic levels of rat Fetua and Fetub

were downregulated. Using ESTs, Olivier et al. (2000) mapped the FETUB gene to 3q27, where the FETUA gene is localized.

[16291]

[16292] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16293] Olivier, E.; Soury, E.; Risler, J. L.; Smith, F.; Schneider, K.; Lochner, K.; Jouzeau, J. Y.; Fey, G. H.; Salier, J. P. : A novel set of hepatic mRNAs preferentially expressed during an acute inflammation in rat represents mostly intracellular proteins. Genomics 57: 352- 364, 1999. ; and

[16294] Olivier, E.; Soury, E.; Ruminy, P.; Husson, A.; Parmentier, F.; Daveau, M.; Salier, J.- P. : Fetuin- B, a second member of the fetuin family in mammals. Biochem. J. 350: 589-597, 2000.

[16295] Further studies establishing the function and utilities of FETUB are found in John Hopkins OMIM database record ID 605954, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ10211 (Accession XP_290820.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ10211 BINDING SITE is a target binding site found in the 3` untranslated re-

gion of mRNA encoded by FLJ10211, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10211 BINDING SITE, designated SEQ ID:10874, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16296] Another function of GAM96 is therefore inhibition of FLJ10211 (Accession XP_290820.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10211.

[16297] FLJ10260 (Accession NP_060512.2) is another GAM96 target gene, herein designated TARGET GENE. FLJ10260 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ10260, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10260 BINDING SITE, designated SEQ ID:3452, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16298] Another function of GAM96 is therefore inhibition of FLJ10260 (Accession NP_060512.2) . Accordingly, utilities

of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10260.

[16299] FLJ10751 (Accession NP_060709.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ10751 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ10751, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10751 BINDING SITE, designated SEQ ID:18465, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16300] Another function of GAM96 is therefore inhibition of FLJ10751 (Accession NP_060709.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10751.

[16301] FLJ10751 (Accession NP_060675.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ10751 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ10751, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of FLJ10751 BINDING SITE, designated SEQ ID:18465, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16302] Another function of GAM96 is therefore inhibition of FLJ10751 (Accession NP_060675.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10751.

[16303] FLJ11011 (Accession NP_060769.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ11011 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11011, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11011 BINDING SITE, designated SEQ ID:16891, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16304] Another function of GAM96 is therefore inhibition of FLJ11011 (Accession NP_060769.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11011.

[16305] FLJ11117 (Accession NP_060799.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ11117

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11117, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11117 BINDING SITE, designated SEQ ID:582, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16306] Another function of GAM96 is therefore inhibition of FLJ11117 (Accession NP_060799.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11117.

[16307] FLJ11320 (Accession NP_060859.2) is another GAM96 target gene, herein designated TARGET GENE. FLJ11320 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11320, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11320 BINDING SITE, designated SEQ ID:18433, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16308] Another function of GAM96 is therefore inhibition of

FLJ11320 (Accession NP_060859.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11320.

[16309] FLJ12287 (Accession NP_071762.2) is another GAM96 target gene, herein designated TARGET GENE. FLJ12287 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12287, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12287 BINDING SITE, designated SEQ ID:15505, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16310] Another function of GAM96 is therefore inhibition of FLJ12287 (Accession NP_071762.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12287.

[16311] FLJ12592 (Accession NP_115545.2) is another GAM96 target gene, herein designated TARGET GENE. FLJ12592 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ12592, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ12592 BINDING SITE, designated SEQ ID:6618, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16312] Another function of GAM96 is therefore inhibition of FLJ12592 (Accession NP_115545.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12592.

[16313] FLJ12806 (Accession NP_073742.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ12806 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12806, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12806 BINDING SITE, designated SEQ ID:1666, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16314] Another function of GAM96 is therefore inhibition of FLJ12806 (Accession NP_073742.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12806.

[16315] FLJ14800 (Accession NP_116229.1) is another GAM96 tar-

get gene, herein designated TARGET GENE. FLJ14800 BINDING SITE1 and FLJ14800 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ14800, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14800 BINDING SITE1 and FLJ14800 BINDING SITE2, designated SEQ ID:9483 and SEQ ID:5726 respectively, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16316] Another function of GAM96 is therefore inhibition of FLJ14800 (Accession NP_116229.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14800.

[16317] FLJ20320 (Accession NP_060235.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ20320 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20320, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20320 BINDING SITE, designated SEQ ID:18080, to the

nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16318] Another function of GAM96 is therefore inhibition of FLJ20320 (Accession NP_060235.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20320.

[16319] FLJ20337 (Accession NP_060242.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ20337 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20337, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20337 BINDING SITE, designated SEQ ID:5583, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16320] Another function of GAM96 is therefore inhibition of FLJ20337 (Accession NP_060242.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20337.

[16321] FLJ20509 (Accession NP_060321.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ20509 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by FLJ20509, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20509 BINDING SITE, designated SEQ ID:3424, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16322] Another function of GAM96 is therefore inhibition of FLJ20509 (Accession NP_060321.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20509.

[16323] FLJ21603 (Accession NP_079038.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ21603 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21603, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21603 BINDING SITE, designated SEQ ID:6263, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16324] Another function of GAM96 is therefore inhibition of FLJ21603 (Accession NP_079038.1) . Accordingly, utilities

of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21603.

[16325] FLJ22353 (Accession NP_078863.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ22353 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22353, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22353 BINDING SITE, designated SEQ ID:6381, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16326] Another function of GAM96 is therefore inhibition of FLJ22353 (Accession NP_078863.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22353.

[16327] FLJ22386 (Accession NP_078865.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ22386 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22386, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22386 BINDING SITE, designated SEQ ID:8060, to the nucleotide sequence of GAM96 RNA, herein designated

GAM RNA, also designated SEQ ID:394.

[16328] Another function of GAM96 is therefore inhibition of FLJ22386 (Accession NP_078865.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22386.

[16329] FLJ22578 (Accession NP_079140.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ22578 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22578, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22578 BINDING SITE, designated SEQ ID:15354, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16330] Another function of GAM96 is therefore inhibition of FLJ22578 (Accession NP_079140.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22578.

[16331] FLJ23168 (Accession NP_079331.2) is another GAM96 target gene, herein designated TARGET GENE. FLJ23168 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23168, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23168 BINDING SITE, designated SEQ ID:9803, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16332] Another function of GAM96 is therefore inhibition of FLJ23168 (Accession NP_079331.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23168.

[16333] FLJ30092 (Accession NP_659420.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ30092 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30092, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30092 BINDING SITE, designated SEQ ID:7410, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16334] Another function of GAM96 is therefore inhibition of FLJ30092 (Accession NP_659420.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ30092.

[16335] FLJ30317 (Accession NP_742148.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ30317 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30317, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30317 BINDING SITE, designated SEQ ID:19948, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16336] Another function of GAM96 is therefore inhibition of FLJ30317 (Accession NP_742148.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30317.

[16337] FLJ30791 (Accession NP_653295.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ30791 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ30791, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30791 BINDING SITE, designated SEQ ID:4121, to the

nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16338] Another function of GAM96 is therefore inhibition of FLJ30791 (Accession NP_653295.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30791.

[16339] FLJ31340 (Accession NP_689961.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ31340 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31340, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31340 BINDING SITE, designated SEQ ID:2540, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16340] Another function of GAM96 is therefore inhibition of FLJ31340 (Accession NP_689961.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31340.

[16341] FLJ31737 (Accession NP_659421.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ31737 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ31737, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31737 BINDING SITE, designated SEQ ID:8026, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16342] Another function of GAM96 is therefore inhibition of FLJ31737 (Accession NP_659421.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31737.

[16343] FLJ32830 (Accession NP_689994.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ32830 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ32830, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32830 BINDING SITE, designated SEQ ID:16084, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16344] Another function of GAM96 is therefore inhibition of FLJ32830 (Accession NP_689994.1) . Accordingly, utilities

of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32830.

[16345] FLJ35866 (Accession XP_300990.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ35866 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by FLJ35866, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35866 BINDING SITE, designated SEQ ID:1168, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16346] Another function of GAM96 is therefore inhibition of FLJ35866 (Accession XP_300990.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35866.

[16347] FLJ38377 (Accession NP_689911.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ38377 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ38377, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ38377 BINDING SITE, designated SEQ ID:13942, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16348] Another function of GAM96 is therefore inhibition of FLJ38377 (Accession NP_689911.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38377.

[16349] FLJ38426 (Accession NP_775882.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ38426 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38426, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38426 BINDING SITE, designated SEQ ID:13647, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16350] Another function of GAM96 is therefore inhibition of FLJ38426 (Accession NP_775882.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38426.

[16351] FLJ38608 (Accession NP_694947.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ38608

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ38608, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ38608 BINDING SITE, designated SEQ ID:12240, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16352] Another function of GAM96 is therefore inhibition of FLJ38608 (Accession NP_694947.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ38608.

[16353] FLJ39058 (Accession NP_775851.1) is another GAM96 target gene, herein designated TARGET GENE. FLJ39058 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39058, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39058 BINDING SITE, designated SEQ ID:7832, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16354] Another function of GAM96 is therefore inhibition of

FLJ39058 (Accession NP_775851.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39058.

[16355] Fragile x mental retardation 2 (FMR2, Accession NP_002016.1) is another GAM96 target gene, herein designated TARGET GENE. FMR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FMR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FMR2 BINDING SITE, designated SEQ ID:12667, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16356] Another function of GAM96 is therefore inhibition of Fragile x mental retardation 2 (FMR2, Accession NP_002016.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMR2.

[16357] Grb2-associated binding protein 3 (GAB3, Accession NP_542179.1) is another GAM96 target gene, herein designated TARGET GENE. GAB3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GAB3, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAB3 BINDING SITE, designated SEQ ID:19604, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16358] Another function of GAM96 is therefore inhibition of Grb2-associated binding protein 3 (GAB3, Accession NP_542179.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB3.

[16359] Udp-n-acetyl-alpha-d-galactosamine:polypeptide n-acetylgalactosaminyltransferase 2 (galnac-t2) (GALNT2, Accession NP_004472.1) is another GAM96 target gene, herein designated TARGET GENE. GALNT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GALNT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GALNT2 BINDING SITE, designated SEQ ID:3290, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16360] Another function of GAM96 is therefore inhibition of Udp-

n-acetyl-alpha-d-galactosamine:polypeptide n-acetylgalactosaminyltransferase 2 (galnac-t2) (GALNT2, Accession NP_004472.1), a gene which catalyzes the initial reaction in o- linked oligosaccharide biosynthesis. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT2.

[16361] The function of GALNT2 has been established by previous studies. UDP- N- acetyl- alpha- D- galactosamine:polypeptide N- acetylgalactosaminyltransferase (GalNAc- T; EC 2.4.1.41) transfers an N- acetyl galactosamine (OMIM Ref. No. GalNAc) to the hydroxyl group of a serine or threonine residue in the first step of O- linked oligosaccharide biosynthesis. White et al. (1995) purified GALNT2, termed GalNAc- T2 by them, from human placenta, using a defined synthetic acceptor peptide as an affinity ligand. They also identified a cDNA for GALNT2 using polymerase chain reaction with primers derived from the protein sequence of the purified GALNT2. The GALNT2 cDNA encodes a predicted 571- amino acid protein of approximately 64 kD (White et al., 1995). Bennett et al. (1998) found that the GALNT1 (OMIM Ref. No. 602273), GALNT2, and GALNT3 (OMIM Ref. No. 601756)

genes contain 11, 16, and 10 exons, respectively. Several intron/exon boundaries are conserved within the 3 genes. By FISH, Bennett et al. (1998) mapped the GALNT2 gene to chromosome 1q41- q42.

[16362]

[16363] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16364] Bennett, E. P.; Weghuis, D. O.; Merkx, G.; Geurts van Kessel, A.; Eiberg, H.; Clausen, H. : Genomic organization and chromosomal localization of three members of the UDP- N- acetylgalactosamine:polypeptide N- acetylgalac- tosaminyltransferase family. Glycobiology 8: 547- 555, 1998. ; and

[16365] White, T.; Bennett, E. P.; Takio, K.; Sorensen, T.; Bonding, N.; Clausen, H. : Purification and cDNA cloning of a human UDP- N- acetyl- alpha- D- galactosamine:polypeptide N- acetylgalactosam.

[16366] Further studies establishing the function and utilities of GALNT2 are found in John Hopkins OMIM database record ID 602274, and in cited publications listed in Table 5, which are hereby incorporated by reference.Glycoprotein a repetitions predominant (GARP, Accession NP_005503.1)

is another GAM96 target gene, herein designated TARGET GENE. GARP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GARP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GARP BINDING SITE, designated SEQ ID:7696, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16367] Another function of GAM96 is therefore inhibition of Glycoprotein a repetitions predominant (GARP, Accession NP_005503.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GARP.

[16368] Golgi apparatus protein 1 (GLG1, Accession NP_036333.1) is another GAM96 target gene, herein designated TARGET GENE. GLG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GLG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GLG1 BINDING SITE, designated SEQ ID:19296, to the nucleotide sequence of GAM96 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:394.

[16369] Another function of GAM96 is therefore inhibition of Golgi apparatus protein 1 (GLG1, Accession NP_036333.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLG1.

[16370] Guanine nucleotide binding protein (g protein), beta 5 (GNB5, Accession NP_006569.1) is another GAM96 target gene, herein designated TARGET GENE. GNB5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GNB5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNB5 BINDING SITE, designated SEQ ID:19704, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16371] Another function of GAM96 is therefore inhibition of Guanine nucleotide binding protein (g protein), beta 5 (GNB5, Accession NP_006569.1), a gene which functions as a modulator or transducer in various transmembrane signaling systems. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with GNB5.

[16372] The function of GNB5 has been established by previous studies. Using a degenerate PCR approach to screen a human brain cDNA library, Jones et al. (1998) cloned the beta- 5 subunit, symbolized GNB5, of G protein. In contrast to beta subunits 1 through 4, which are at least 83% homologous, GNB5 is only 50% homologous to the other beta subunits. On the other hand, the predicted 353-amino acid protein sequence is 99.4% homologous to the mouse beta- 5 protein, with only 2 conservative amino acid differences. Northern blot analysis revealed that mouse Gnb5 is expressed predominantly in brain (Watson et al., 1994), whereas human GNB5 is expressed at high levels not only in brain but also in pancreas, kidney, and heart (Jones et al., 1998), as a major 3.0- and minor 2.0- and 9.0- kb transcripts. Within the brain, (Jones et al., 1998) detected highest expression in cerebellum, cerebral cortex, occipital pole, frontal lobe, temporal lobe, and caudate putamen, and lowest expression in corpus callosum and spinal cord.

[16373] Animal model experiments lend further support to the function of GNB5. The 'flailer' (flr) mouse exhibits a phenotype consisting of frequent falling, convulsive limb

movements (leg flailing), and ataxia persistent into adulthood. Jones et al. (2000) determined that the flailer mouse expresses a novel gene combining the promoter and first 2 exons of Gnb5 with the C- terminal exons of the closely linked myosin- 5A (MyoVA) gene (Myo5a; 160777). Biochemical and genetic studies indicated that the flailer protein, which is expressed predominantly in brain, competes with wildtype MyoVA in vivo, preventing the localization of smooth endoplasmic reticulum vesicles in the dendritic spines of cerebellar Purkinje cells. The flailer protein thus has a dominant- negative mechanism of action with a recessive mode of inheritance due to the dependence of competitive binding on the ratio between mutant and wildtype proteins. The chromosomal arrangement of Myo5a upstream of Gnb5 is consistent with nonhomologous recombination as the mutational mechanism.

[16374] It is appreciated that the abovementioned animal model for GNB5 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[16375] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16376] Jones, J. M.; Huang, J.- D.; Mermall, V.; Hamilton, B. A.; Mooseker, M. S.; Escayg, A.; Copeland, N. G.; Jenkins, N. A.; Meisler, M. H. : The mouse neurological mutant flailer expresses a novel hybrid gene derived by exon shuffling between Gnb5 and Myo5a. Hum. Molec. Genet. 9: 821-828, 2000. ; and

[16377] Watson, A. J.; Katz, A.; Simon, M. I. : A fifth member of the mammalian G- protein beta subunit family: expression in brain and activation of the beta- 2 isotype of phospholipase C. J.

[16378] Further studies establishing the function and utilities of GNB5 are found in John Hopkins OMIM database record ID 604447, and in cited publications listed in Table 5, which are hereby incorporated by reference.Guanine nucleotide binding protein (g protein), beta 5 (GNB5, Accession NP_057278.2) is another GAM96 target gene, herein designated TARGET GENE. GNB5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GNB5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNB5 BINDING SITE, designated SEQ ID:19704, to the nucleotide

sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16379] Another function of GAM96 is therefore inhibition of Guanine nucleotide binding protein (g protein), beta 5 (GNB5, Accession NP_057278.2), a gene which functions as a modulator or transducer in various transmembrane signaling systems. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB5.

[16380] The function of GNB5 has been established by previous studies. Using a degenerate PCR approach to screen a human brain cDNA library, Jones et al. (1998) cloned the beta- 5 subunit, symbolized GNB5, of G protein. In contrast to beta subunits 1 through 4, which are at least 83% homologous, GNB5 is only 50% homologous to the other beta subunits. On the other hand, the predicted 353-amino acid protein sequence is 99.4% homologous to the mouse beta- 5 protein, with only 2 conservative amino acid differences. Northern blot analysis revealed that mouse Gnb5 is expressed predominantly in brain (Watson et al., 1994), whereas human GNB5 is expressed at high levels not only in brain but also in pancreas, kidney, and heart (Jones et al., 1998), as a major 3.0- and minor 2.0-

and 9.0- kb transcripts. Within the brain, (Jones et al., 1998) detected highest expression in cerebellum, cerebral cortex, occipital pole, frontal lobe, temporal lobe, and caudate putamen, and lowest expression in corpus callosum and spinal cord.

[16381] Animal model experiments lend further support to the function of GNB5. The 'flailer' (flr) mouse exhibits a phenotype consisting of frequent falling, convulsive limb movements (leg flailing), and ataxia persistent into adulthood. Jones et al. (2000) determined that the flailer mouse expresses a novel gene combining the promoter and first 2 exons of Gnb5 with the C- terminal exons of the closely linked myosin- 5A (MyoVA) gene (Myo5a; 160777). Biochemical and genetic studies indicated that the flailer protein, which is expressed predominantly in brain, competes with wildtype MyoVA in vivo, preventing the localization of smooth endoplasmic reticulum vesicles in the dendritic spines of cerebellar Purkinje cells. The flailer protein thus has a dominant- negative mechanism of action with a recessive mode of inheritance due to the dependence of competitive binding on the ratio between mutant and wildtype proteins. The chromosomal arrangement of Myo5a upstream of Gnb5 is consistent with non-

homologous recombination as the mutational mechanism.

[16382] It is appreciated that the abovementioned animal model for GNB5 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[16383] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16384] Jones, J. M.; Huang, J.- D.; Mermall, V.; Hamilton, B. A.; Mooseker, M. S.; Escayg, A.; Copeland, N. G.; Jenkins, N. A.; Meisler, M. H. : The mouse neurological mutant flailer expresses a novel hybrid gene derived by exon shuffling between Gnb5 and Myo5a. Hum. Molec. Genet. 9: 821-828, 2000. ; and

[16385] Watson, A. J.; Katz, A.; Simon, M. I. : A fifth member of the mammalian G- protein beta subunit family: expression in brain and activation of the beta- 2 isotype of phospholipase C. J.

[16386] Further studies establishing the function and utilities of GNB5 are found in John Hopkins OMIM database record ID 604447, and in cited publications listed in Table 5, which are hereby incorporated by reference.GNPNAT1 (Accession XP_085119.1) is another GAM96 target gene, herein des-

ignated TARGET GENE. GNPNAT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GNPNAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNPNAT1 BINDING SITE, designated SEQ ID:8591, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16387] Another function of GAM96 is therefore inhibition of GNPNAT1 (Accession XP_085119.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNPNAT1.

[16388] Golgi autoantigen, golgin subfamily a, 4 (GOLGA4, Accession NP_002069.2) is another GAM96 target gene, herein designated TARGET GENE. GOLGA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GOLGA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GOLGA4 BINDING SITE, designated SEQ ID:12047, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also

designated SEQ ID:394.

[16389] Another function of GAM96 is therefore inhibition of Golgi autoantigen, golgin subfamily a, 4 (GOLGA4, Accession NP_002069.2), a gene which may play a role in vesicular transport from the trans- golgi. and therefore may be associated with Disease sjoegren's syndrome and in hepatitis b. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of Disease sjoegren's syndrome and in hepatitis b., and of other diseases and clinical conditions associated with GOLGA4.

[16390] The function of GOLGA4 has been established by previous studies. To characterize the Golgi complex, Kooy et al. (1992) used serum from a Sjogren syndrome (OMIM Ref. No. 270150) patient with a high titer of anti- Golgi autoantibodies. The serum immunoprecipitated a 230- kD protein that was specifically localized to the cytosolic surface of what is probably the trans- face of the Golgi stack. The 230- kD Golgi protein appears to be a peripheral membrane component. The authors detected the 230- kD antigen in several cell types and species. By screening a HeLa cell cDNA expression library with the anti- Golgi autoantibodies, Erlich et al. (1996) identified a p230 cDNA. The 7.7- kb p230 mRNA encodes a 2,230- amino acid

protein with a predicted coiled- coil structure, stabilized by heptad repeats. The p230 protein also contains a granin motif (see OMIM Ref. No. 113705). By SDS- PAGE, p230 from HeLa cells migrates as a 230- kD protein. Daigo et al. (1999) found that the trans- Golgi gene contains at least 11 exons. Independently, Fritzler et al. (1995) cloned a partial GOLGA4 cDNA using serum from a Sjogren syndrome patient. Based on its predicted molecular mass, they designated the GOLGA4 protein 'golgin- 245.'

[16391]

[16392] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16393] Daigo, Y.; Isomura, M.; Nishiwaki, T.; Tamari, M.; Ishikawa, S.; Kai, M.; Murata, Y.; Takeuchi, K.; Yamane, Y.; Hayashi, R.; Minami, M.; Fujino, M. A.; Hojo, Y.; Uchiyama, I.; Takagi, T.; Nakamura, Y. : Characterization of a 1200- kb genomic segment of chromosome 3p22- p21.3. DNA Res. 6: 37- 44, 1999. ; and

[16394] Fritzler, M. J.; Lung, C.- C.; Hamel, J. C.; Griffith, K. J.; Chan, E. K. L. : Molecular characterization of golgin- 245, a novel Golgi complex protein containing a granin signa-

ture. J. B.

[16395] Further studies establishing the function and utilities of GOLGA4 are found in John Hopkins OMIM database record ID 602509, and in cited publications listed in Table 5, which are hereby incorporated by reference.Golgi reassembly stacking protein 1, 65kda (GORASP1, Accession NP_114105.1) is another GAM96 target gene, herein designated TARGET GENE. GORASP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GORASP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GORASP1 BINDING SITE, designated SEQ ID:8526, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16396] Another function of GAM96 is therefore inhibition of Golgi reassembly stacking protein 1, 65kda (GORASP1, Accession NP_114105.1), a gene which has some funtion with the Golgi apparatus. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GORASP1.

[16397] The function of GORASP1 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM75.1.Glycoprotein m6a (GPM6A, Accession NP_005268.1) is another GAM96 target gene, herein designated TARGET GENE. GPM6A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPM6A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPM6A BINDING SITE, designated SEQ ID:14453, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16398] Another function of GAM96 is therefore inhibition of Glycoprotein m6a (GPM6A, Accession NP_005268.1), a gene which may play a role in neuronal development. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPM6A.

[16399] The function of GPM6A has been established by previous studies. Yan et al. (1993) used monoclonal antibodies raised against antigens in mouse brain fractions to isolate 2 related cDNAs from an expression library. The cDNAs, which they designated M6a and M6b (OMIM Ref. No.

300051), are highly similar to the myelin proteolipid protein (OMIM Ref. No. 300401) and are expressed during early development of the mouse central nervous system (CNS). Olinsky et al. (1996) found that the M6a gene (GPM6A) is expressed only in neurons. They obtained partial human genomic and cDNA clones for M6a and mapped the gene to 4q34 by fluorescence in situ hybridization. M6, a cell surface glycoprotein mainly expressed on neurons in the murine CNS, plays significant roles in neural cell adhesion and some aspects of neurite growth (Lagenaur et al., 1992). Shimizu et al. (1996) isolated a human cDNA that is highly homologous to the murine gene, symbolized Gpm6, that encodes M6. The human gene, GPM6A, contains an open reading frame of 834 nucleotides encoding a peptide of 278 amino acids. Northern blot analysis revealed specific expression in human brain. By radiation hybrid mapping, Shimizu et al. (1996) assigned the GPM6A gene to 4q33- q34.

[16400]

[16401] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16402] Shimizu, F.; Watanabe, T. K.; Fujiwara, T.; Takahashi, E.;

Nakamura, Y.; Maekawa, H. : Isolation and mapping of the human glycoprotein M6 gene (GPM6A) to 4q33- to- q34. Cytogenet. Cell Genet. 74: 138- 139, 1996. ; and

[16403] Yan, Y.; Lagenaur, C.; Narayanan, V. : Molecular cloning of M6: identification of a PLP/DM20 gene family. Neuron 11: 423- 431, 1993.

[16404] Further studies establishing the function and utilities of GPM6A are found in John Hopkins OMIM database record ID 601275, and in cited publications listed in Table 5, which are hereby incorporated by reference.G protein-coupled receptor 26 (GPR26, Accession NP_703143.1) is another GAM96 target gene, herein designated TARGET GENE. GPR26 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR26, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR26 BINDING SITE, designated SEQ ID:8305, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16405] Another function of GAM96 is therefore inhibition of G protein-coupled receptor 26 (GPR26, Accession NP_703143.1) . Accordingly, utilities of GAM96 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR26.

[16406] G protein-coupled receptor 63 (GPR63, Accession NP_110411.1) is another GAM96 target gene, herein designated TARGET GENE. GPR63 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPR63, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR63 BINDING SITE, designated SEQ ID:9429, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16407] Another function of GAM96 is therefore inhibition of G protein-coupled receptor 63 (GPR63, Accession NP_110411.1), a gene which transduces extracellular signals through heterotrimeric G proteins. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR63.

[16408] The function of GPR63 has been established by previous studies. Using degenerate primers designed from sequence conserved between Xenopus and mouse PSP24 homologs, Kawasawa et al. (2000) cloned GPR63, which

they called PSP24B, by PCR followed by RACE using human brain mRNA as template. The deduced 419- amino acid protein shares 57% identity with Xenopus PSP24 and 92% identity with the mouse homolog. Lee et al. (2001) identified GPR63 within a human genomic DNA library using GPR61 (OMIM Ref. No. 606916) as probe. Primers to the intronless sequence were synthesized, and GPR63 cDNA was amplified by PCR and cloned. Northern blot analysis revealed expression of a single 6.8- kb transcript in various brain regions, with stronger expression in caudate and thalamus, and fainter expression in hypothalamus and midbrain. Kawasawa et al. (2000) cloned mouse Gpr63, which they called mPSP24B, by screening a mouse genomic library with the cDNA fragment of Xenopus PSP24. The 6.0- kb mouse transcript was expressed almost exclusively in brain. In situ hybridization of mouse brain sections revealed expression in neuronal cells such as olfactory mitral cells, cortical neurons, hippocampal pyramidal cells, and Purkinje cells in the cerebellum. Kawasawa et al. (2000) noted that Xenopus PSP24 was originally identified as a lysophosphatidic acid receptor (LPA). Functional analysis of mouse Gpr63 transfected into a rat hepatoma cell line suggested that the mouse protein

does not function as an LPA receptor.

[16409]

[16410] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16411] Kawasawa, Y.; Kume, K.; Nakade, S.; Haga, H.; Izumi, T.; Shimizu, T. : Brain- specific expression of novel G- protein- coupled receptors, with homologies to Xenopus PSP24 and human GPR45. Biochem. Biophys. Res. Commun. 276: 952- 956, 2000. ; and

[16412] Lee, D. K.; George, S. R.; Cheng, R.; Nguyen, T.; Liu, Y.; Brown, M.; Lynch, K. R.; O'Dowd, B. F. : Identification of four novel human G protein- coupled receptors expressed in the brai.

[16413] Further studies establishing the function and utilities of GPR63 are found in John Hopkins OMIM database record ID 606915, and in cited publications listed in Table 5, which are hereby incorporated by reference.G protein-coupled receptor kinase 2-like (drosophila) (GPRK2L, Accession NP_005298.1) is another GAM96 target gene, herein designated TARGET GENE. GPRK2L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPRK2L, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPRK2L BINDING SITE, designated SEQ ID:7782, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16414] Another function of GAM96 is therefore inhibition of G protein-coupled receptor kinase 2-like (drosophila) (GPRK2L, Accession NP_005298.1), a gene which plays a role in receptor desensitization. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRK2L.

[16415] The function of GPRK2L has been established by previous studies. Premont et al. (1996) determined that there are 4 isoforms of GPRK2L, or GRK4. The full- length protein contains 578 amino acids, while the splice variants enode proteins that contain 546, 532, and 500 amino acids due to the absence of exon 2, exon 15, and both exons 2 and 15, respectively. Northern blot analysis of 16 human tissues detected high expression of a 2.5- kb GPRK2L transcript only in testis. Sallese et al. (1997) showed that only the full- length GRK4 protein has kinase activity and that it interacts with and is inhibitable by calmodulin (CALM1;

114180).

[16416]

[16417] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16418] Premont, R. T.; Macrae, A. D.; Stoffel, R. H.; Chung, N.; Pitcher, J. A.; Ambrose, C.; Inglese, J.; MacDonald, M. E.; Lefkowitz, R. J. : Characterization of the G protein- coupled receptor kinase GRK4: identification of four splice variants. J. Biol. Chem. 271: 6403- 6410, 1996. ; and

[16419] Sallese, M.; Mariggio, S.; Collodel, G.; Moretti, E.; Piomboni, P.; Baccetti, B.; De Blasi, A. : G protein- coupled receptor kinase GRK4: molecular analysis of the four isoforms and ult.

[16420] Further studies establishing the function and utilities of GPRK2L are found in John Hopkins OMIM database record ID 137026, and in cited publications listed in Table 5, which are hereby incorporated by reference.GRCC9 (Accession NP_116030.1) is another GAM96 target gene, herein designated TARGET GENE. GRCC9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GRCC9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRCC9 BINDING SITE, designated SEQ ID:4675, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16421] Another function of GAM96 is therefore inhibition of GRCC9 (Accession NP_116030.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRCC9.

[16422] Hbs1-like (s. cerevisiae) (HBS1L, Accession NP_006611.1) is another GAM96 target gene, herein designated TARGET GENE. HBS1L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HBS1L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HBS1L BINDING SITE, designated SEQ ID:17413, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16423] Another function of GAM96 is therefore inhibition of Hbs1-like (s. cerevisiae) (HBS1L, Accession NP_006611.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with HBS1L.

[16424] HIST2H2BE (Accession NP_003519.1) is another GAM96 target gene, herein designated TARGET GENE. HIST2H2BE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HIST2H2BE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIST2H2BE BINDING SITE, designated SEQ ID:6859, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16425] Another function of GAM96 is therefore inhibition of HIST2H2BE (Accession NP_003519.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIST2H2BE.

[16426] Histocompatibility (minor) 13 (HM13, Accession NP_848697.1) is another GAM96 target gene, herein designated TARGET GENE. HM13 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HM13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of HM13 BINDING SITE, designated SEQ ID:9742, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16427] Another function of GAM96 is therefore inhibition of Histocompatibility (minor) 13 (HM13, Accession NP_848697.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HM13.

[16428] HTCD37 (Accession NP_067045.1) is another GAM96 target gene, herein designated TARGET GENE. HTCD37 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTCD37, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HTCD37 BINDING SITE, designated SEQ ID:16787, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16429] Another function of GAM96 is therefore inhibition of HTCD37 (Accession NP_067045.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTCD37.

[16430] HUMAGCGB (Accession XP_291083.2) is another GAM96 target gene, herein designated TARGET GENE. HUMAGCGB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HUMAGCGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HUMAGCGB BINDING SITE, designated SEQ ID:10039, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16431] Another function of GAM96 is therefore inhibition of HUMAGCGB (Accession XP_291083.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUMAGCGB.

[16432] HUMAGCGB (Accession NP_037418.2) is another GAM96 target gene, herein designated TARGET GENE. HUMAGCGB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HUMAGCGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of HUMAGCGB BINDING SITE, designated SEQ ID:10039, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16433] Another function of GAM96 is therefore inhibition of HUMAGCGB (Accession NP_037418.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUMAGCGB.

[16434] Iduronate 2-sulfatase (hunter syndrome) (IDS, Accession NP_000193.1) is another GAM96 target gene, herein designated TARGET GENE. IDS BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IDS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IDS BINDING SITE, designated SEQ ID:2510, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16435] Another function of GAM96 is therefore inhibition of Iduronate 2-sulfatase (hunter syndrome) (IDS, Accession NP_000193.1) . Accordingly, utilities of GAM96 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with IDS.

[16436] Interleukin enhancer binding factor 3, 90kda (ILF3, Accession NP_036350.2) is another GAM96 target gene, herein designated TARGET GENE. ILF3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ILF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ILF3 BINDING SITE, designated SEQ ID:12695, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16437] Another function of GAM96 is therefore inhibition of Interleukin enhancer binding factor 3, 90kda (ILF3, Accession NP_036350.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ILF3.

[16438] Lysyl-trna synthetase (KARS, Accession NP_005539.1) is another GAM96 target gene, herein designated TARGET GENE. KARS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KARS, corresponding to a target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KARS BINDING SITE, designated SEQ ID:13190, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16439] Another function of GAM96 is therefore inhibition of Lysyl-trna synthetase (KARS, Accession NP_005539.1), a gene which functions in protein biosynthesis and therefore may be associated with Autoimmune diseases. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of Autoimmune diseases, and of other diseases and clinical conditions associated with KARS.

[16440] The function of KARS has been established by previous studies. Protein synthesis is initiated by the attachment of amino acids to cognate tRNAs by aminoacyl- tRNA synthetases. At least 6 of 20 human aminoacyl- tRNA synthetases have been identified as targets of autoantibodies in the autoimmune disease polymyositis/dermatomyositis. One of these is lysyl- tRNA synthetase, symbolized KARS (Targoff et al. (1993)). Tolkunova et al. (2000) identified 2 full- length sequences for KARS and determined that they represent cytoplasmic and mitochondrial isoforms. The 625- amino acid mitochondrial enzyme and the 597-

amino acid cytoplasmic enzyme are identical over the last 576 amino acids, but the mitochondrial enzyme has a different 49- amino acid N terminus containing a mitochondrial targeting sequence. Transfection of both fluorescence- tagged isoforms into an osteosarcoma cell line showed that the cytoplasmic isoform produced a diffuse, cellwide fluorescence, while the mitochondrial isoform resulted in a punctate pattern that colocalized with mitochondrial markers. Ribonuclease protection analysis indicated that the mRNA encoding the cytoplasmic isoform makes up approximately 70%, and the mitochondrial isoform approximately 30%, of mature KARS transcripts. Tolkunova et al. (2000) found that both full- length mitochondrial and cytoplasmic KARS, purified after expression in E. coli, aminoacylated in vitro transcripts corresponding to both the cytoplasmic and mitochondrial tRNA- lys. Tolkunova et al. (2000) determined that the KARS gene contains 15 exons and spans about 20 kb. The cytoplasmic and mitochondrial KARS isoforms result from alternative splicing of the first 3 exons. Tolkunova et al. (2000) found that the initiation codons for KARS and RAP1 (OMIM Ref. No. 605061) are separated by 243 bp. This region lacks a conventional TATA sequence but contains several

SP1 (OMIM Ref. No. 189906)- binding domains oriented in both directions

[16441]

[16442] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16443] Tolkunova, E.; Park, H.; Xia, J.; King, M. P.; Davidson, E. : The human lysyl- tRNA synthetase gene encodes both the cytoplasmic and mitochondrial enzymes by means of an unusual alternative splicing of the primary transcript. J. Biol. Chem. 275: 35063- 35069, 2000. ; and

[16444] Maas, S.; Kim, Y.- G.; Rich, A. : Genomic clustering of tRNA- specific adenosine deaminase ADAT1 and two tRNA synthetases. Mammalian Genome 12: 387- 393, 2001.

[16445] Further studies establishing the function and utilities of KARS are found in John Hopkins OMIM database record ID 601421, and in cited publications listed in Table 5, which are hereby incorporated by reference.KBF2 (Accession NP_056958.1) is another GAM96 target gene, herein designated TARGET GENE. KBF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KBF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KBF2 BINDING SITE, designated SEQ ID:9785, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16446] Another function of GAM96 is therefore inhibition of KBF2 (Accession NP_056958.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KBF2.

[16447] Potassium voltage-gated channel, shaker-related subfamily, member 6 (KCNA6, Accession NP_002226.1) is another GAM96 target gene, herein designated TARGET GENE. KCNA6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNA6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNA6 BINDING SITE, designated SEQ ID:1371, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16448] Another function of GAM96 is therefore inhibition of Potassium voltage-gated channel, shaker-related subfamily, member 6 (KCNA6, Accession NP_002226.1), a gene which mediates the voltage- dependent potassium ion

permeability of excitable membranes. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNA6.

[16449] The function of KCNA6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Kv channel interacting protein 2 (KCNIP2, Accession NP_775284.1) is another GAM96 target gene, herein designated TARGET GENE. KCNIP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNIP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNIP2 BINDING SITE, designated SEQ ID:12228, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16450] Another function of GAM96 is therefore inhibition of Kv channel interacting protein 2 (KCNIP2, Accession NP_775284.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNIP2.

[16451] Kv channel interacting protein 2 (KCNIP2, Accession NP_775283.1) is another GAM96 target gene, herein designated TARGET GENE. KCNIP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNIP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNIP2 BINDING SITE, designated SEQ ID:12228, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16452] Another function of GAM96 is therefore inhibition of Kv channel interacting protein 2 (KCNIP2, Accession NP_775283.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNIP2.

[16453] Kv channel interacting protein 2 (KCNIP2, Accession NP_775287.1) is another GAM96 target gene, herein designated TARGET GENE. KCNIP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNIP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates

the complementarity of the nucleotide sequences of KCNIP2 BINDING SITE, designated SEQ ID:12228, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16454] Another function of GAM96 is therefore inhibition of Kv channel interacting protein 2 (KCNIP2, Accession NP_775287.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNIP2.

[16455] Kv channel interacting protein 2 (KCNIP2, Accession NP_775285.1) is another GAM96 target gene, herein designated TARGET GENE. KCNIP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNIP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNIP2 BINDING SITE, designated SEQ ID:12228, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16456] Another function of GAM96 is therefore inhibition of Kv channel interacting protein 2 (KCNIP2, Accession NP_775285.1) . Accordingly, utilities of GAM96 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNIP2.

[16457] Kv channel interacting protein 2 (KCNIP2, Accession NP_775286.1) is another GAM96 target gene, herein designated TARGET GENE. KCNIP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNIP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNIP2 BINDING SITE, designated SEQ ID:12228, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16458] Another function of GAM96 is therefore inhibition of Kv channel interacting protein 2 (KCNIP2, Accession NP_775286.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNIP2.

[16459] Kv channel interacting protein 2 (KCNIP2, Accession NP_055406.2) is another GAM96 target gene, herein designated TARGET GENE. KCNIP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNIP2, correspond-

ing to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNIP2 BINDING SITE, designated SEQ ID:12228, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16460] Another function of GAM96 is therefore inhibition of Kv channel interacting protein 2 (KCNIP2, Accession NP_055406.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNIP2.

[16461] Kv channel interacting protein 2 (KCNIP2, Accession NP_775464.1) is another GAM96 target gene, herein designated TARGET GENE. KCNIP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNIP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNIP2 BINDING SITE, designated SEQ ID:12228, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16462] Another function of GAM96 is therefore inhibition of Kv

channel interacting protein 2 (KCNIP2, Accession NP_775464.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNIP2.

[16463] Potassium voltage-gated channel, kqt-like subfamily, member 2 (KCNQ2, Accession NP_004509.2) is another GAM96 target gene, herein designated TARGET GENE. KCNQ2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNQ2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNQ2 BINDING SITE, designated SEQ ID:13173, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16464] Another function of GAM96 is therefore inhibition of Potassium voltage-gated channel, kqt-like subfamily, member 2 (KCNQ2, Accession NP_004509.2), a gene which is probably important in the regulation of neuronal excitability. and therefore is associated with Epilepsy, benign neonatal, 1. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of Epilepsy, benign neonatal, 1, and of other diseases and clinical conditions

associated with KCNQ2.

[16465] The function of KCNQ2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.KIAA0056 (Accession XP_166201.1) is another GAM96 target gene, herein designated TARGET GENE. KIAA0056 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0056, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0056 BINDING SITE, designated SEQ ID:13907, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16466] Another function of GAM96 is therefore inhibition of KIAA0056 (Accession XP_166201.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0056.

[16467] KIAA0186 (Accession NP_066545.1) is another GAM96 target gene, herein designated TARGET GENE. KIAA0186 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0186, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0186 BINDING SITE, designated SEQ ID:13734, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16468] Another function of GAM96 is therefore inhibition of KIAA0186 (Accession NP_066545.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0186.

[16469] KIAA0316 (Accession XP_045712.5) is another GAM96 target gene, herein designated TARGET GENE. KIAA0316 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0316, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0316 BINDING SITE, designated SEQ ID:17156, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16470] Another function of GAM96 is therefore inhibition of KIAA0316 (Accession XP_045712.5) . Accordingly, utilities

of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0316.

[16471] KIAA0459 (Accession XP_027862.1) is another GAM96 target gene, herein designated TARGET GENE. KIAA0459 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0459, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:1902, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16472] Another function of GAM96 is therefore inhibition of KIAA0459 (Accession XP_027862.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459.

[16473] KIAA0676 (Accession NP_055858.1) is another GAM96 target gene, herein designated TARGET GENE. KIAA0676 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0676, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0676 BINDING SITE, designated SEQ ID:17472, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16474] Another function of GAM96 is therefore inhibition of KIAA0676 (Accession NP_055858.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0676.

[16475] KIAA0828 (Accession NP_056143.1) is another GAM96 target gene, herein designated TARGET GENE. KIAA0828 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0828, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0828 BINDING SITE, designated SEQ ID:11600, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16476] Another function of GAM96 is therefore inhibition of KIAA0828 (Accession NP_056143.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KIAA0828.

[16477] KIAA0831 (Accession NP_055739.1) is another GAM96 target gene, herein designated TARGET GENE. KIAA0831 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0831, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0831 BINDING SITE, designated SEQ ID:15913, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16478] Another function of GAM96 is therefore inhibition of KIAA0831 (Accession NP_055739.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0831.

[16479] KIAA1036 (Accession NP_055724.1) is another GAM96 target gene, herein designated TARGET GENE. KIAA1036 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1036, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:15246, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16480] Another function of GAM96 is therefore inhibition of KIAA1036 (Accession NP_055724.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036.

[16481] KIAA1045 (Accession XP_048592.1) is another GAM96 target gene, herein designated TARGET GENE. KIAA1045 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:14051, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16482] Another function of GAM96 is therefore inhibition of KIAA1045 (Accession XP_048592.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1045.

[16483] KIAA1332 (Accession XP_048774.2) is another GAM96 target gene, herein designated TARGET GENE. KIAA1332 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1332, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1332 BINDING SITE, designated SEQ ID:419, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16484] Another function of GAM96 is therefore inhibition of KIAA1332 (Accession XP_048774.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1332.

[16485] KIAA1576 (Accession NP_065978.1) is another GAM96 target gene, herein designated TARGET GENE. KIAA1576 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1576, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA1576 BINDING SITE, designated SEQ ID:18988, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16486] Another function of GAM96 is therefore inhibition of KIAA1576 (Accession NP_065978.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1576.

[16487] KIAA1719 (Accession XP_042936.1) is another GAM96 target gene, herein designated TARGET GENE. KIAA1719 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1719, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:18820, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16488] Another function of GAM96 is therefore inhibition of KIAA1719 (Accession XP_042936.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719.

[16489] KIAA1735 (Accession XP_290496.1) is another GAM96 target gene, herein designated TARGET GENE. KIAA1735 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1735, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1735 BINDING SITE, designated SEQ ID:12607, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16490] Another function of GAM96 is therefore inhibition of KIAA1735 (Accession XP_290496.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1735.

[16491] KIAA1765 (Accession XP_047355.1) is another GAM96 target gene, herein designated TARGET GENE. KIAA1765 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1765, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1765 BINDING SITE, designated SEQ ID:7558, to the

nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16492] Another function of GAM96 is therefore inhibition of KIAA1765 (Accession XP_047355.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1765.

[16493] KIAA1924 (Accession NP_694971.2) is another GAM96 target gene, herein designated TARGET GENE. KIAA1924 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1924, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1924 BINDING SITE, designated SEQ ID:9076, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16494] Another function of GAM96 is therefore inhibition of KIAA1924 (Accession NP_694971.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1924.

[16495] KIAA1950 (Accession XP_166532.1) is another GAM96

target gene, herein designated TARGET GENE. KIAA1950 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1950, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1950 BINDING SITE, designated SEQ ID:7520, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16496] Another function of GAM96 is therefore inhibition of KIAA1950 (Accession XP_166532.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950.

[16497] KIP3 (Accession NP_473454.1) is another GAM96 target gene, herein designated TARGET GENE. KIP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIP3 BINDING SITE, designated SEQ ID:7794, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:394.

[16498] Another function of GAM96 is therefore inhibition of KIP3 (Accession NP_473454.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIP3.

[16499] Keratin 23 (histone deacetylase inducible) (KRT23, Accession NP_056330.3) is another GAM96 target gene, herein designated TARGET GENE. KRT23 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by KRT23, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KRT23 BINDING SITE, designated SEQ ID:1919, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16500] Another function of GAM96 is therefore inhibition of Keratin 23 (histone deacetylase inducible) (KRT23, Accession NP_056330.3) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRT23.

[16501] Lanc lantibiotic synthetase component c-like 1 (bacterial) (LANCL1, Accession NP_006046.1) is another GAM96 tar-

get gene, herein designated TARGET GENE. LANCL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LANCL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LANCL1 BINDING SITE, designated SEQ ID:3104, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16502] Another function of GAM96 is therefore inhibition of Lanc lantibiotic synthetase component c-like 1 (bacterial) (LANCL1, Accession NP_006046.1), a gene which binds the C- terminus of stomatin. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANCL1.

[16503] The function of LANCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM88.2.Lanc lantibiotic synthetase component c-like 2 (bacterial) (LANCL2, Accession NP_061167.1) is another GAM96 target gene, herein designated TARGET GENE. LANCL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LANCL2, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LANCL2 BINDING SITE, designated SEQ ID:15186, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16504] Another function of GAM96 is therefore inhibition of Lanc lantibiotic synthetase component c-like 2 (bacterial) (LANCL2, Accession NP_061167.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANCL2.

[16505] LOC118812 (Accession XP_058346.2) is another GAM96 target gene, herein designated TARGET GENE. LOC118812 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC118812, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC118812 BINDING SITE, designated SEQ ID:17463, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16506] Another function of GAM96 is therefore inhibition of

LOC118812 (Accession XP_058346.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118812.

[16507] LOC118812 (Accession NP_849154.1) is another GAM96 target gene, herein designated TARGET GENE. LOC118812 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC118812, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC118812 BINDING SITE, designated SEQ ID:17463, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16508] Another function of GAM96 is therefore inhibition of LOC118812 (Accession NP_849154.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118812.

[16509] LOC123232 (Accession XP_058692.1) is another GAM96 target gene, herein designated TARGET GENE. LOC123232 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC123232, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC123232 BINDING SITE, designated SEQ ID:6644, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16510] Another function of GAM96 is therefore inhibition of LOC123232 (Accession XP_058692.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123232.

[16511] LOC130612 (Accession XP_059461.1) is another GAM96 target gene, herein designated TARGET GENE. LOC130612 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC130612, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130612 BINDING SITE, designated SEQ ID:8428, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16512] Another function of GAM96 is therefore inhibition of

LOC130612 (Accession XP_059461.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130612.

[16513] LOC134466 (Accession XP_068858.3) is another GAM96 target gene, herein designated TARGET GENE. LOC134466 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC134466, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC134466 BINDING SITE, designated SEQ ID:18543, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16514] Another function of GAM96 is therefore inhibition of LOC134466 (Accession XP_068858.3) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134466.

[16515] LOC139135 (Accession NP_775764.1) is another GAM96 target gene, herein designated TARGET GENE. LOC139135 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC139135, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC139135 BINDING SITE, designated SEQ ID:5578, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16516] Another function of GAM96 is therefore inhibition of LOC139135 (Accession NP_775764.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139135.

[16517] LOC146174 (Accession NP_775772.1) is another GAM96 target gene, herein designated TARGET GENE. LOC146174 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146174, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146174 BINDING SITE, designated SEQ ID:13043, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16518] Another function of GAM96 is therefore inhibition of LOC146174 (Accession NP_775772.1) . Accordingly, utili-

ties of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146174.

[16519] LOC147515 (Accession XP_097243.1) is another GAM96 target gene, herein designated TARGET GENE. LOC147515 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147515, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147515 BINDING SITE, designated SEQ ID:8521, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16520] Another function of GAM96 is therefore inhibition of LOC147515 (Accession XP_097243.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147515.

[16521] LOC148824 (Accession XP_097527.1) is another GAM96 target gene, herein designated TARGET GENE. LOC148824 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148824, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148824 BINDING SITE, designated SEQ ID:2847, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16522] Another function of GAM96 is therefore inhibition of LOC148824 (Accession XP_097527.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148824.

[16523] LOC150035 (Accession XP_097793.1) is another GAM96 target gene, herein designated TARGET GENE. LOC150035 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150035, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150035 BINDING SITE, designated SEQ ID:452, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16524] Another function of GAM96 is therefore inhibition of LOC150035 (Accession XP_097793.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150035.

[16525] LOC150212 (Accession XP_086827.2) is another GAM96 target gene, herein designated TARGET GENE. LOC150212 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150212, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150212 BINDING SITE, designated SEQ ID:2217, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16526] Another function of GAM96 is therefore inhibition of LOC150212 (Accession XP_086827.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150212.

[16527] LOC150946 (Accession XP_097977.2) is another GAM96 target gene, herein designated TARGET GENE. LOC150946 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150946, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC150946 BINDING SITE, designated SEQ ID:1643, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16528] Another function of GAM96 is therefore inhibition of LOC150946 (Accession XP_097977.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150946.

[16529] LOC153277 (Accession XP_295161.1) is another GAM96 target gene, herein designated TARGET GENE. LOC153277 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC153277, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153277 BINDING SITE, designated SEQ ID:1123, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16530] Another function of GAM96 is therefore inhibition of LOC153277 (Accession XP_295161.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC153277.

[16531] LOC155004 (Accession XP_088114.2) is another GAM96 target gene, herein designated TARGET GENE. LOC155004 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC155004, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC155004 BINDING SITE, designated SEQ ID:3970, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16532] Another function of GAM96 is therefore inhibition of LOC155004 (Accession XP_088114.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155004.

[16533] LOC157226 (Accession XP_033876.1) is another GAM96 target gene, herein designated TARGET GENE. LOC157226 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157226, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC157226 BINDING SITE, designated SEQ ID:18145, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16534] Another function of GAM96 is therefore inhibition of LOC157226 (Accession XP_033876.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157226.

[16535] LOC157562 (Accession XP_098779.1) is another GAM96 target gene, herein designated TARGET GENE. LOC157562 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157562, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157562 BINDING SITE, designated SEQ ID:7115, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16536] Another function of GAM96 is therefore inhibition of LOC157562 (Accession XP_098779.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157562.

[16537] LOC158812 (Accession XP_088679.1) is another GAM96 target gene, herein designated TARGET GENE. LOC158812 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158812, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158812 BINDING SITE, designated SEQ ID:11303, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16538] Another function of GAM96 is therefore inhibition of LOC158812 (Accession XP_088679.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158812.

[16539] LOC158813 (Accession XP_088680.1) is another GAM96 target gene, herein designated TARGET GENE. LOC158813 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158813, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158813 BINDING SITE, designated SEQ ID:11303, to

the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16540] Another function of GAM96 is therefore inhibition of LOC158813 (Accession XP_088680.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158813.

[16541] LOC167691 (Accession XP_094623.1) is another GAM96 target gene, herein designated TARGET GENE. LOC167691 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC167691, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC167691 BINDING SITE, designated SEQ ID:8140, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16542] Another function of GAM96 is therefore inhibition of LOC167691 (Accession XP_094623.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC167691.

[16543] LOC196483 (Accession XP_016909.6) is another GAM96

target gene, herein designated TARGET GENE. LOC196483 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC196483, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196483 BINDING SITE, designated SEQ ID:14696, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16544] Another function of GAM96 is therefore inhibition of LOC196483 (Accession XP_016909.6) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196483.

[16545] LOC199858 (Accession XP_114040.1) is another GAM96 target gene, herein designated TARGET GENE. LOC199858 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC199858, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:11822, to the nucleotide sequence of GAM96 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:394.

[16546] Another function of GAM96 is therefore inhibition of LOC199858 (Accession XP_114040.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858.

[16547] LOC200609 (Accession XP_117256.1) is another GAM96 target gene, herein designated TARGET GENE. LOC200609 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC200609, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:1503, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16548] Another function of GAM96 is therefore inhibition of LOC200609 (Accession XP_117256.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609.

[16549] LOC200895 (Accession NP_789785.1) is another GAM96 target gene, herein designated TARGET GENE. LOC200895

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200895, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200895 BINDING SITE, designated SEQ ID:11068, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16550] Another function of GAM96 is therefore inhibition of LOC200895 (Accession NP_789785.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200895.

[16551] LOC200916 (Accession XP_114317.3) is another GAM96 target gene, herein designated TARGET GENE. LOC200916 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200916, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200916 BINDING SITE, designated SEQ ID:903, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16552] Another function of GAM96 is therefore inhibition of LOC200916 (Accession XP_114317.3) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200916.

[16553] LOC201725 (Accession XP_114370.1) is another GAM96 target gene, herein designated TARGET GENE. LOC201725 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC201725, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201725 BINDING SITE, designated SEQ ID:3356, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16554] Another function of GAM96 is therefore inhibition of LOC201725 (Accession XP_114370.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201725.

[16555] LOC219919 (Accession XP_167785.1) is another GAM96 target gene, herein designated TARGET GENE. LOC219919 BINDING SITE1 and LOC219919 BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by LOC219919, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219919 BINDING SITE1 and LOC219919 BINDING SITE2, designated SEQ ID:13602 and SEQ ID:6258 respectively, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16556] Another function of GAM96 is therefore inhibition of LOC219919 (Accession XP_167785.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219919.

[16557] LOC222057 (Accession XP_166594.2) is another GAM96 target gene, herein designated TARGET GENE. LOC222057 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC222057, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222057 BINDING SITE, designated SEQ ID:6288, to the nucleotide sequence of GAM96 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:394.

[16558] Another function of GAM96 is therefore inhibition of LOC222057 (Accession XP_166594.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222057.

[16559] LOC222171 (Accession NP_787083.1) is another GAM96 target gene, herein designated TARGET GENE. LOC222171 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC222171, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222171 BINDING SITE, designated SEQ ID:10483, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16560] Another function of GAM96 is therefore inhibition of LOC222171 (Accession NP_787083.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222171.

[16561] LOC253573 (Accession XP_173110.1) is another GAM96 target gene, herein designated TARGET GENE. LOC253573

BINDING SITE1 and LOC253573 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC253573, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253573 BINDING SITE1 and LOC253573 BINDING SITE2, designated SEQ ID:4331 and SEQ ID:18972 respectively, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16562] Another function of GAM96 is therefore inhibition of LOC253573 (Accession XP_173110.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253573.

[16563] LOC255480 (Accession XP_172895.1) is another GAM96 target gene, herein designated TARGET GENE. LOC255480 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC255480, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255480 BINDING SITE, designated SEQ ID:18477, to

the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16564] Another function of GAM96 is therefore inhibition of LOC255480 (Accession XP_172895.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255480.

[16565] LOC256248 (Accession XP_172550.1) is another GAM96 target gene, herein designated TARGET GENE. LOC256248 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC256248, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256248 BINDING SITE, designated SEQ ID:8993, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16566] Another function of GAM96 is therefore inhibition of LOC256248 (Accession XP_172550.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256248.

[16567] LOC283104 (Accession XP_210888.1) is another GAM96

target gene, herein designated TARGET GENE. LOC283104 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283104, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283104 BINDING SITE, designated SEQ ID:9301, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16568] Another function of GAM96 is therefore inhibition of LOC283104 (Accession XP_210888.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283104.

[16569] LOC283331 (Accession XP_210977.1) is another GAM96 target gene, herein designated TARGET GENE. LOC283331 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283331, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283331 BINDING SITE, designated SEQ ID:3714, to the nucleotide sequence of GAM96 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:394.

[16570] Another function of GAM96 is therefore inhibition of LOC283331 (Accession XP_210977.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283331.

[16571] LOC283724 (Accession XP_208806.1) is another GAM96 target gene, herein designated TARGET GENE. LOC283724 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283724, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283724 BINDING SITE, designated SEQ ID:17874, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16572] Another function of GAM96 is therefore inhibition of LOC283724 (Accession XP_208806.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283724.

[16573] LOC283731 (Accession XP_211184.1) is another GAM96 target gene, herein designated TARGET GENE. LOC283731

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283731, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283731 BINDING SITE, designated SEQ ID:2171, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16574] Another function of GAM96 is therefore inhibition of LOC283731 (Accession XP_211184.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283731.

[16575] LOC283834 (Accession XP_211225.1) is another GAM96 target gene, herein designated TARGET GENE. LOC283834 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283834, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283834 BINDING SITE, designated SEQ ID:17890, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16576] Another function of GAM96 is therefore inhibition of LOC283834 (Accession XP_211225.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283834.

[16577] LOC284023 (Accession XP_208983.3) is another GAM96 target gene, herein designated TARGET GENE. LOC284023 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284023, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284023 BINDING SITE, designated SEQ ID:10544, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16578] Another function of GAM96 is therefore inhibition of LOC284023 (Accession XP_208983.3) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284023.

[16579] LOC284031 (Accession XP_208982.1) is another GAM96 target gene, herein designated TARGET GENE. LOC284031 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC284031, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284031 BINDING SITE, designated SEQ ID:14747, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16580] Another function of GAM96 is therefore inhibition of LOC284031 (Accession XP_208982.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284031.

[16581] LOC284054 (Accession XP_208987.1) is another GAM96 target gene, herein designated TARGET GENE. LOC284054 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284054, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284054 BINDING SITE, designated SEQ ID:14039, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16582] Another function of GAM96 is therefore inhibition of

LOC284054 (Accession XP_208987.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284054.

[16583] LOC284057 (Accession XP_208989.1) is another GAM96 target gene, herein designated TARGET GENE. LOC284057 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284057, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284057 BINDING SITE, designated SEQ ID:19081, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16584] Another function of GAM96 is therefore inhibition of LOC284057 (Accession XP_208989.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284057.

[16585] LOC284117 (Accession XP_209024.1) is another GAM96 target gene, herein designated TARGET GENE. LOC284117 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284117, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284117 BINDING SITE, designated SEQ ID:4099, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16586] Another function of GAM96 is therefore inhibition of LOC284117 (Accession XP_209024.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284117.

[16587] LOC284305 (Accession XP_211425.1) is another GAM96 target gene, herein designated TARGET GENE. LOC284305 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284305, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284305 BINDING SITE, designated SEQ ID:11555, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16588] Another function of GAM96 is therefore inhibition of LOC284305 (Accession XP_211425.1) . Accordingly, utili-

ties of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284305.

[16589] LOC284325 (Accession XP_209143.1) is another GAM96 target gene, herein designated TARGET GENE. LOC284325 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284325, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284325 BINDING SITE, designated SEQ ID:833, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16590] Another function of GAM96 is therefore inhibition of LOC284325 (Accession XP_209143.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284325.

[16591] LOC284440 (Accession XP_209210.1) is another GAM96 target gene, herein designated TARGET GENE. LOC284440 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284440, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284440 BINDING SITE, designated SEQ ID:11999, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16592] Another function of GAM96 is therefore inhibition of LOC284440 (Accession XP_209210.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284440.

[16593] LOC284452 (Accession XP_211469.1) is another GAM96 target gene, herein designated TARGET GENE. LOC284452 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284452, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284452 BINDING SITE, designated SEQ ID:9502, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16594] Another function of GAM96 is therefore inhibition of LOC284452 (Accession XP_211469.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC284452.

[16595] LOC284473 (Accession XP_211474.1) is another GAM96 target gene, herein designated TARGET GENE. LOC284473 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284473, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284473 BINDING SITE, designated SEQ ID:6210, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16596] Another function of GAM96 is therefore inhibition of LOC284473 (Accession XP_211474.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284473.

[16597] LOC284600 (Accession XP_211548.1) is another GAM96 target gene, herein designated TARGET GENE. LOC284600 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284600, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC284600 BINDING SITE, designated SEQ ID:8522, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16598] Another function of GAM96 is therefore inhibition of LOC284600 (Accession XP_211548.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284600.

[16599] LOC284759 (Accession XP_209363.1) is another GAM96 target gene, herein designated TARGET GENE. LOC284759 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284759, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284759 BINDING SITE, designated SEQ ID:11795, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16600] Another function of GAM96 is therefore inhibition of LOC284759 (Accession XP_209363.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC284759.

[16601] LOC284831 (Accession XP_211644.1) is another GAM96 target gene, herein designated TARGET GENE. LOC284831 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284831, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284831 BINDING SITE, designated SEQ ID:13771, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16602] Another function of GAM96 is therefore inhibition of LOC284831 (Accession XP_211644.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284831.

[16603] LOC285033 (Accession XP_211739.1) is another GAM96 target gene, herein designated TARGET GENE. LOC285033 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285033, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC285033 BINDING SITE, designated SEQ ID:933, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16604] Another function of GAM96 is therefore inhibition of LOC285033 (Accession XP_211739.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285033.

[16605] LOC285173 (Accession XP_211795.1) is another GAM96 target gene, herein designated TARGET GENE. LOC285173 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285173, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285173 BINDING SITE, designated SEQ ID:17372, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16606] Another function of GAM96 is therefore inhibition of LOC285173 (Accession XP_211795.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285173.

[16607] LOC285191 (Accession XP_211802.1) is another GAM96 target gene, herein designated TARGET GENE. LOC285191 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285191, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285191 BINDING SITE, designated SEQ ID:9868, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16608] Another function of GAM96 is therefore inhibition of LOC285191 (Accession XP_211802.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285191.

[16609] LOC285205 (Accession XP_211805.1) is another GAM96 target gene, herein designated TARGET GENE. LOC285205 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285205, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285205 BINDING SITE, designated SEQ ID:11893, to

the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16610] Another function of GAM96 is therefore inhibition of LOC285205 (Accession XP_211805.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285205.

[16611] LOC285266 (Accession XP_211823.1) is another GAM96 target gene, herein designated TARGET GENE. LOC285266 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285266, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285266 BINDING SITE, designated SEQ ID:8215, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16612] Another function of GAM96 is therefore inhibition of LOC285266 (Accession XP_211823.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285266.

[16613] LOC285295 (Accession XP_211833.1) is another GAM96

target gene, herein designated TARGET GENE. LOC285295 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285295, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285295 BINDING SITE, designated SEQ ID:13602, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16614] Another function of GAM96 is therefore inhibition of LOC285295 (Accession XP_211833.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285295.

[16615] LOC285309 (Accession XP_211839.1) is another GAM96 target gene, herein designated TARGET GENE. LOC285309 BINDING SITE1 and LOC285309 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC285309, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285309 BINDING SITE1 and LOC285309 BINDING SITE2, designated SEQ ID:6068

and SEQ ID:13602 respectively, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16616] Another function of GAM96 is therefore inhibition of LOC285309 (Accession XP_211839.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285309.

[16617] LOC285506 (Accession XP_209641.1) is another GAM96 target gene, herein designated TARGET GENE. LOC285506 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285506, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285506 BINDING SITE, designated SEQ ID:4219, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16618] Another function of GAM96 is therefore inhibition of LOC285506 (Accession XP_209641.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285506.

[16619] LOC285556 (Accession XP_211939.1) is another GAM96 target gene, herein designated TARGET GENE. LOC285556 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285556, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285556 BINDING SITE, designated SEQ ID:1124, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16620] Another function of GAM96 is therefore inhibition of LOC285556 (Accession XP_211939.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285556.

[16621] LOC285638 (Accession XP_209693.1) is another GAM96 target gene, herein designated TARGET GENE. LOC285638 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285638, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285638 BINDING SITE, designated SEQ ID:16938, to

the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16622] Another function of GAM96 is therefore inhibition of LOC285638 (Accession XP_209693.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285638.

[16623] LOC285673 (Accession XP_209720.1) is another GAM96 target gene, herein designated TARGET GENE. LOC285673 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285673, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285673 BINDING SITE, designated SEQ ID:9819, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16624] Another function of GAM96 is therefore inhibition of LOC285673 (Accession XP_209720.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285673.

[16625] LOC285744 (Accession XP_209743.1) is another GAM96

target gene, herein designated TARGET GENE. LOC285744 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285744, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285744 BINDING SITE, designated SEQ ID:10189, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16626] Another function of GAM96 is therefore inhibition of LOC285744 (Accession XP_209743.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285744.

[16627] LOC285851 (Accession XP_212039.1) is another GAM96 target gene, herein designated TARGET GENE. LOC285851 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285851, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285851 BINDING SITE, designated SEQ ID:9838, to the nucleotide sequence of GAM96 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:394.

[16628] Another function of GAM96 is therefore inhibition of LOC285851 (Accession XP_212039.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285851.

[16629] LOC285951 (Accession XP_212090.1) is another GAM96 target gene, herein designated TARGET GENE. LOC285951 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285951, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285951 BINDING SITE, designated SEQ ID:4449, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16630] Another function of GAM96 is therefore inhibition of LOC285951 (Accession XP_212090.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285951.

[16631] LOC286218 (Accession XP_212235.1) is another GAM96 target gene, herein designated TARGET GENE. LOC286218

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286218, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286218 BINDING SITE, designated SEQ ID:2398, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16632] Another function of GAM96 is therefore inhibition of LOC286218 (Accession XP_212235.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286218.

[16633] LOC338746 (Accession XP_290549.1) is another GAM96 target gene, herein designated TARGET GENE. LOC338746 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338746, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338746 BINDING SITE, designated SEQ ID:9649, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16634] Another function of GAM96 is therefore inhibition of LOC338746 (Accession XP_290549.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338746.

[16635] LOC338799 (Accession XP_290580.1) is another GAM96 target gene, herein designated TARGET GENE. LOC338799 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC338799, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338799 BINDING SITE, designated SEQ ID:19175, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16636] Another function of GAM96 is therefore inhibition of LOC338799 (Accession XP_290580.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338799.

[16637] LOC338899 (Accession XP_294740.1) is another GAM96 target gene, herein designated TARGET GENE. LOC338899

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338899, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338899 BINDING SITE, designated SEQ ID:5337, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16638] Another function of GAM96 is therefore inhibition of LOC338899 (Accession XP_294740.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338899.

[16639] LOC339062 (Accession XP_294795.1) is another GAM96 target gene, herein designated TARGET GENE. LOC339062 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339062, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339062 BINDING SITE, designated SEQ ID:10862, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16640] Another function of GAM96 is therefore inhibition of LOC339062 (Accession XP_294795.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339062.

[16641] LOC339373 (Accession XP_294921.1) is another GAM96 target gene, herein designated TARGET GENE. LOC339373 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339373, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339373 BINDING SITE, designated SEQ ID:12281, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16642] Another function of GAM96 is therefore inhibition of LOC339373 (Accession XP_294921.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339373.

[16643] LOC339378 (Accession XP_294923.1) is another GAM96 target gene, herein designated TARGET GENE. LOC339378 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC339378, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339378 BINDING SITE, designated SEQ ID:13147, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16644] Another function of GAM96 is therefore inhibition of LOC339378 (Accession XP_294923.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339378.

[16645] LOC339622 (Accession XP_295016.1) is another GAM96 target gene, herein designated TARGET GENE. LOC339622 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339622, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339622 BINDING SITE, designated SEQ ID:4595, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16646] Another function of GAM96 is therefore inhibition of

LOC339622 (Accession XP_295016.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339622.

[16647] LOC339669 (Accession XP_290982.1) is another GAM96 target gene, herein designated TARGET GENE. LOC339669 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339669, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339669 BINDING SITE, designated SEQ ID:4448, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16648] Another function of GAM96 is therefore inhibition of LOC339669 (Accession XP_290982.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339669.

[16649] LOC340074 (Accession XP_295148.1) is another GAM96 target gene, herein designated TARGET GENE. LOC340074 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340074, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340074 BINDING SITE, designated SEQ ID:5987, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16650] Another function of GAM96 is therefore inhibition of LOC340074 (Accession XP_295148.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340074.

[16651] LOC340170 (Accession XP_291160.1) is another GAM96 target gene, herein designated TARGET GENE. LOC340170 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340170, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340170 BINDING SITE, designated SEQ ID:7614, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16652] Another function of GAM96 is therefore inhibition of LOC340170 (Accession XP_291160.1) . Accordingly, utili-

ties of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340170.

[16653] LOC340353 (Accession XP_295221.1) is another GAM96 target gene, herein designated TARGET GENE. LOC340353 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340353, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340353 BINDING SITE, designated SEQ ID:4624, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16654] Another function of GAM96 is therefore inhibition of LOC340353 (Accession XP_295221.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340353.

[16655] LOC340464 (Accession XP_291300.1) is another GAM96 target gene, herein designated TARGET GENE. LOC340464 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340464, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340464 BINDING SITE, designated SEQ ID:6259, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16656] Another function of GAM96 is therefore inhibition of LOC340464 (Accession XP_291300.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340464.

[16657] LOC340850 (Accession XP_295799.1) is another GAM96 target gene, herein designated TARGET GENE. LOC340850 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340850, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340850 BINDING SITE, designated SEQ ID:2511, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16658] Another function of GAM96 is therefore inhibition of LOC340850 (Accession XP_295799.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC340850.

[16659] LOC347864 (Accession XP_302614.1) is another GAM96 target gene, herein designated TARGET GENE. LOC347864 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347864, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347864 BINDING SITE, designated SEQ ID:1097, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16660] Another function of GAM96 is therefore inhibition of LOC347864 (Accession XP_302614.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347864.

[16661] LOC347888 (Accession XP_302563.1) is another GAM96 target gene, herein designated TARGET GENE. LOC347888 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347888, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC347888 BINDING SITE, designated SEQ ID:3644, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16662] Another function of GAM96 is therefore inhibition of LOC347888 (Accession XP_302563.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347888.

[16663] LOC348528 (Accession XP_302814.1) is another GAM96 target gene, herein designated TARGET GENE. LOC348528 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348528, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348528 BINDING SITE, designated SEQ ID:17828, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16664] Another function of GAM96 is therefore inhibition of LOC348528 (Accession XP_302814.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC348528.

[16665] LOC349049 (Accession XP_300919.1) is another GAM96 target gene, herein designated TARGET GENE. LOC349049 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349049, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349049 BINDING SITE, designated SEQ ID:19254, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16666] Another function of GAM96 is therefore inhibition of LOC349049 (Accession XP_300919.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349049.

[16667] LOC349234 (Accession XP_300987.1) is another GAM96 target gene, herein designated TARGET GENE. LOC349234 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC349234, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC349234 BINDING SITE, designated SEQ ID:4813, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16668] Another function of GAM96 is therefore inhibition of LOC349234 (Accession XP_300987.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349234.

[16669] LOC349256 (Accession XP_300994.1) is another GAM96 target gene, herein designated TARGET GENE. LOC349256 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349256, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349256 BINDING SITE, designated SEQ ID:19187, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16670] Another function of GAM96 is therefore inhibition of LOC349256 (Accession XP_300994.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349256.

[16671] LOC349351 (Accession XP_028319.4) is another GAM96 target gene, herein designated TARGET GENE. LOC349351 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349351, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349351 BINDING SITE, designated SEQ ID:19187, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16672] Another function of GAM96 is therefore inhibition of LOC349351 (Accession XP_028319.4) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349351.

[16673] LOC63928 (Accession NP_071380.1) is another GAM96 target gene, herein designated TARGET GENE. LOC63928 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC63928, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC63928 BINDING SITE, designated SEQ ID:7473, to the

nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16674] Another function of GAM96 is therefore inhibition of LOC63928 (Accession NP_071380.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC63928.

[16675] LOC90906 (Accession XP_034809.1) is another GAM96 target gene, herein designated TARGET GENE. LOC90906 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC90906, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE, designated SEQ ID:5553, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16676] Another function of GAM96 is therefore inhibition of LOC90906 (Accession XP_034809.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906.

[16677] LOC91266 (Accession XP_037268.1) is another GAM96

target gene, herein designated TARGET GENE. LOC91266 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91266, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91266 BINDING SITE, designated SEQ ID:4369, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16678] Another function of GAM96 is therefore inhibition of LOC91266 (Accession XP_037268.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91266.

[16679] LOC92230 (Accession XP_043733.1) is another GAM96 target gene, herein designated TARGET GENE. LOC92230 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC92230, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92230 BINDING SITE, designated SEQ ID:18989, to the nucleotide sequence of GAM96 RNA, herein designated

GAM RNA, also designated SEQ ID:394.

[16680] Another function of GAM96 is therefore inhibition of LOC92230 (Accession XP_043733.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92230.

[16681] Microtubule-associated protein 6 (MAP6, Accession XP_166256.1) is another GAM96 target gene, herein designated TARGET GENE. MAP6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAP6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP6 BINDING SITE, designated SEQ ID:11998, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16682] Another function of GAM96 is therefore inhibition of Microtubule-associated protein 6 (MAP6, Accession XP_166256.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP6.

[16683] Max gene associated (MGA, Accession XP_031689.3) is another GAM96 target gene, herein designated TARGET

GENE. MGA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGA BINDING SITE, designated SEQ ID:2236, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16684] Another function of GAM96 is therefore inhibition of Max gene associated (MGA, Accession XP_031689.3), a gene which plays a role in the final steps of digestion of starch. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGA.

[16685] The function of MGA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.MGC10233 (Accession NP_689928.1) is another GAM96 target gene, herein designated TARGET GENE. MGC10233 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10233, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10233 BINDING SITE, designated SEQ ID:12991, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16686] Another function of GAM96 is therefore inhibition of MGC10233 (Accession NP_689928.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10233.

[16687] MGC10812 (Accession NP_113613.1) is another GAM96 target gene, herein designated TARGET GENE. MGC10812 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10812, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10812 BINDING SITE, designated SEQ ID:3998, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16688] Another function of GAM96 is therefore inhibition of MGC10812 (Accession NP_113613.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC10812.

[16689] MGC13125 (Accession NP_116114.1) is another GAM96 target gene, herein designated TARGET GENE. MGC13125 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC13125, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC13125 BINDING SITE, designated SEQ ID:5483, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16690] Another function of GAM96 is therefore inhibition of MGC13125 (Accession NP_116114.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13125.

[16691] MGC2474 (Accession NP_076420.1) is another GAM96 target gene, herein designated TARGET GENE. MGC2474 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC2474, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC2474 BINDING SITE, designated SEQ ID:17757, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16692] Another function of GAM96 is therefore inhibition of MGC2474 (Accession NP_076420.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2474.

[16693] MGC26733 (Accession NP_659429.2) is another GAM96 target gene, herein designated TARGET GENE. MGC26733 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC26733, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC26733 BINDING SITE, designated SEQ ID:18016, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16694] Another function of GAM96 is therefore inhibition of MGC26733 (Accession NP_659429.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26733.

[16695] MGC2749 (Accession NP_076974.1) is another GAM96 target gene, herein designated TARGET GENE. MGC2749 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC2749, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC2749 BINDING SITE, designated SEQ ID:680, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16696] Another function of GAM96 is therefore inhibition of MGC2749 (Accession NP_076974.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2749.

[16697] MGC3222 (Accession NP_077310.1) is another GAM96 target gene, herein designated TARGET GENE. MGC3222 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3222, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3222 BINDING SITE, designated SEQ ID:11500, to the nucleotide sequence of GAM96 RNA, herein designated

GAM RNA, also designated SEQ ID:394.

[16698] Another function of GAM96 is therefore inhibition of MGC3222 (Accession NP_077310.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3222.

[16699] MGC34680 (Accession NP_689559.1) is another GAM96 target gene, herein designated TARGET GENE. MGC34680 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC34680, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC34680 BINDING SITE, designated SEQ ID:1068, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16700] Another function of GAM96 is therefore inhibition of MGC34680 (Accession NP_689559.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC34680.

[16701] MGC34695 (Accession NP_775826.1) is another GAM96 target gene, herein designated TARGET GENE. MGC34695 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by MGC34695, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC34695 BINDING SITE, designated SEQ ID:14230, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16702] Another function of GAM96 is therefore inhibition of MGC34695 (Accession NP_775826.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC34695.

[16703] MGC35206 (Accession NP_848647.1) is another GAM96 target gene, herein designated TARGET GENE. MGC35206 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC35206, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC35206 BINDING SITE, designated SEQ ID:4448, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16704] Another function of GAM96 is therefore inhibition of

MGC35206 (Accession NP_848647.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35206.

[16705] MGC42530 (Accession NP_775841.1) is another GAM96 target gene, herein designated TARGET GENE. MGC42530 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC42530, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC42530 BINDING SITE, designated SEQ ID:12415, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16706] Another function of GAM96 is therefore inhibition of MGC42530 (Accession NP_775841.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC42530.

[16707] MGC4734 (Accession NP_659488.1) is another GAM96 target gene, herein designated TARGET GENE. MGC4734 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4734, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4734 BINDING SITE, designated SEQ ID:12722, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16708] Another function of GAM96 is therefore inhibition of MGC4734 (Accession NP_659488.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4734.

[16709] MGC5508 (Accession NP_076997.1) is another GAM96 target gene, herein designated TARGET GENE. MGC5508 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC5508, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC5508 BINDING SITE, designated SEQ ID:15558, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16710] Another function of GAM96 is therefore inhibition of MGC5508 (Accession NP_076997.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with MGC5508.

[16711] Myeloid/lymphoid or mixed-lineage leukemia (trithorax homolog, drosophila); translocated to, 2 (MLLT2, Accession NP_005926.1) is another GAM96 target gene, herein designated TARGET GENE. MLLT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MLLT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MLLT2 BINDING SITE, designated SEQ ID:15646, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16712] Another function of GAM96 is therefore inhibition of Myeloid/lymphoid or mixed-lineage leukemia (trithorax homolog, drosophila); translocated to, 2 (MLLT2, Accession NP_005926.1), a gene which is a Putative transcription factor. and therefore is associated with Acute leukemias. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of Acute leukemias, and of other diseases and clinical conditions associated with MLLT2.

[16713] The function of MLLT2 has been established by previous studies. Nakamura et al. (1993) found that the gene on

chromosome 4q21 that is fused with the ALL1 gene in patients with acute lymphoblastic leukemia and translocation t(4;11)(q21;q23) and the gene on chromosome 9 that is fused with the ALL1 gene on chromosome 11 in patients with leukemia and the t(9;11)(p22;q23) show high sequence homology with the ENL gene on chromosome 19 which is fused to the ALL1 gene in patients with leukemia and the translocation t(11;19)(q23;p13). They found further that the protein products of the AF4, AF9 (MLLT3), and ENL (MLLT1) genes contained nuclear targeting sequences as well as serine- rich and proline- rich regions. Stretches abundant in basic amino acids were also present in the 3 proteins. These results indicated that the different proteins fused to ALL1 polypeptides in leukemia provide similar functional domains. Uckun et al. (1998) analyzed bone marrow leukemic cells of 17 infants and 127 children with newly diagnosed acute lymphatic leukemia (ALL), as well as fetal liver and bone marrow and normal infant bone marrow samples for the presence of a t(4;11) translocation, using standard cytogenetic techniques and expression of an MLL- AF4 fusion transcript by standard RT- PCR assays as well as nested RT- PCR that is 100-fold more sensitive than the standard RT- PCR. Overall, 9

of the 17 infants and 17 of 127 noninfant pediatric ALL patients were positive for expression of MLL- AF4 fusion transcripts. None of the MLL- AF4(+) cases were positive for E2A- PBX1 (147141; 176310) or BCR- ABL (151410; 189980) fusion transcript expression. Although 8 of 9 MLL- AF4(+) infants had cytogenetically detectable t(4;11) translocation, 15 of the 17 MLL- AF4(+) noninfants were t(4;11) negative. Infants with MLL- AF4(+) ALL had poor outcomes, whereas noninfant fusion- gene- positive, translocation- negative patients has favorable outcomes similar to MLL- AF4(-) patients. Notably, MLL- AF4 transcripts also were detected by nested RT- PCR in 4 of 16 fetal bone marrows, 5 of 13 fetal livers, and 1 of 6 normal infant bone marrows, but not in any of the 44 remission bone marrow specimens from pediatric ALL patients. These results represented unprecedented evidence that MLL- AF4 fusion transcripts can be present in normal hematopoietic cells, indicating that their expression is insufficient for leukemic transformation of normal lymphocyte precursors.

[16714]

[16715] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[16716] Nakamura, T.; Alder, H.; Gu, Y.; Prasad, R.; Canaani, O.; Kamada, N.; Gale, R. P.; Lange, B.; Crist, W. M.; Nowell, P. C.; Croce, C. M.; Canaani, E. : Genes on chromosomes 4, 9, and 19 involved in 11q23 abnormalities in acute leukemia share sequence homology and/or common motifs. Proc. Nat. Acad. Sci. 90: 4631- 4635, 1993. ; and

[16717] Uckun, F. M.; Herman- Hatten, K.; Crotty, M.- L.; Sensel, M. G.; Sather, H. N.; Tuel- Ahlgren, L.; Sarquis, M. B.; Bostrom, B.; Nachman, J. B.; Steinherz, P. G.; Gaynon, P. S.; Heerema, N.

[16718] Further studies establishing the function and utilities of MLLT2 are found in John Hopkins OMIM database record ID 159557, and in cited publications listed in Table 5, which are hereby incorporated by reference.MLR2 (Accession XP_050988.1) is another GAM96 target gene, herein designated TARGET GENE. MLR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MLR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MLR2 BINDING SITE, designated SEQ ID:18894, to the nucleotide sequence of

GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16719] Another function of GAM96 is therefore inhibition of MLR2 (Accession XP_050988.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLR2.

[16720] Mitochondrial ribosomal protein s12 (MRPS12, Accession NP_203527.1) is another GAM96 target gene, herein designated TARGET GENE. MRPS12 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MRPS12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPS12 BINDING SITE, designated SEQ ID:9214, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16721] Another function of GAM96 is therefore inhibition of Mitochondrial ribosomal protein s12 (MRPS12, Accession NP_203527.1), a gene which is a component of the mitochondrial ribosome. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS12.

[16722] The function of MRPS12 has been established by previous studies. accuracy center. To characterize human nuclear genes encoding components of the mitochondrial gene expression machinery, Shah et al. (1998) searched an expressed sequence tag (EST) database with the amino acid sequence of E. coli rpsL. They isolated over 30 ESTs comprising a single contig in both human and mouse, and they stated that this indicates RPMS12 is likely a single-copy gene in the genomes of these mammals. The RPMS12 protein has an N- terminal extension containing basic and hydroxyl- group amino acids, consistent with a role for RPMS12 in mitochondrial targeting. Johnson et al. (1998) cloned the gene encoding human mitochondrial ribosomal protein S12 based on its homology to the Drosophila tko gene. They found that the gene stretches over 1.7 kb of genomic DNA. The mRNA showed 3 distinct patterns of splicing within the 5- prime untranslated region, with 1 form predominant over the other 2, in all human tissues examined. The coding region of the leader sequence is interrupted in codon 17 by a second intron of 990 bp. The predicted protein is translated as a prepeptide of 138 amino acids and processed to a peptide of 112 amino acids with a molecular mass of 12.3 kD. The au-

thors pointed out that the functional role of RPMS12 makes it a candidate gene for susceptibility to aminoglycoside ototoxicity (OMIM Ref. No. 580000), which in some cases is demonstrably due to mutation in the mitochondrial gene encoding mitochondrial ribosomal RNA 12S, MTRNR1 (OMIM Ref. No. 561000).

[16723]

[16724] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16725] Johnson, D. F.; Hamon, M.; Fischel- Ghodsian, N. : Characterization of the human mitochondrial ribosomal S12 gene. Genomics 52: 363- 368, 1998. ; and

[16726] Shah, Z. H.; Migliosi, V.; Miller, S. C. M.; Wang, A.; Friedman, T. B.; Jacobs, H. T. : Chromosomal locations of three human nuclear genes (RPSM12, TUFM, and AFG3L1) specifying putative.

[16727] Further studies establishing the function and utilities of MRPS12 are found in John Hopkins OMIM database record ID 603021, and in cited publications listed in Table 5, which are hereby incorporated by reference.Mitochondrial ribosomal protein s12 (MRPS12, Accession NP_066930.1) is another GAM96 target gene, herein designated TARGET

GENE. MRPS12 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MRPS12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPS12 BINDING SITE, designated SEQ ID:9214, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16728] Another function of GAM96 is therefore inhibition of Mitochondrial ribosomal protein s12 (MRPS12, Accession NP_066930.1), a gene which is a component of the mitochondrial ribosome. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS12.

[16729] The function of MRPS12 has been established by previous studies. accuracy center. To characterize human nuclear genes encoding components of the mitochondrial gene expression machinery, Shah et al. (1998) searched an expressed sequence tag (EST) database with the amino acid sequence of E. coli rpsL. They isolated over 30 ESTs comprising a single contig in both human and mouse, and they stated that this indicates RPMS12 is likely a single-

copy gene in the genomes of these mammals. The RPMS12 protein has an N- terminal extension containing basic and hydroxyl- group amino acids, consistent with a role for RPMS12 in mitochondrial targeting. Johnson et al. (1998) cloned the gene encoding human mitochondrial ribosomal protein S12 based on its homology to the Drosophila tko gene. They found that the gene stretches over 1.7 kb of genomic DNA. The mRNA showed 3 distinct patterns of splicing within the 5- prime untranslated region, with 1 form predominant over the other 2, in all human tissues examined. The coding region of the leader sequence is interrupted in codon 17 by a second intron of 990 bp. The predicted protein is translated as a prepeptide of 138 amino acids and processed to a peptide of 112 amino acids with a molecular mass of 12.3 kD. The authors pointed out that the functional role of RPMS12 makes it a candidate gene for susceptibility to aminoglycoside ototoxicity (OMIM Ref. No. 580000), which in some cases is demonstrably due to mutation in the mitochondrial gene encoding mitochondrial ribosomal RNA 12S, MTRNR1 (OMIM Ref. No. 561000).

[16730]

[16731] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[16732] Johnson, D. F.; Hamon, M.; Fischel- Ghodsian, N. : Characterization of the human mitochondrial ribosomal S12 gene. Genomics 52: 363- 368, 1998. ; and

[16733] Shah, Z. H.; Migliosi, V.; Miller, S. C. M.; Wang, A.; Friedman, T. B.; Jacobs, H. T. : Chromosomal locations of three human nuclear genes (RPSM12, TUFM, and AFG3L1) specifying putative.

[16734] Further studies establishing the function and utilities of MRPS12 are found in John Hopkins OMIM database record ID 603021, and in cited publications listed in Table 5, which are hereby incorporated by reference.Musculin (activated b-cell factor-1) (MSC, Accession NP_005089.1) is another GAM96 target gene, herein designated TARGET GENE. MSC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MSC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MSC BINDING SITE, designated SEQ ID:2216, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16735] Another function of GAM96 is therefore inhibition of Musculin (activated b-cell factor-1) (MSC, Accession NP_005089.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSC.

[16736] N-acetyltransferase 5 (ard1 homolog, s. cerevisiae) (NAT5, Accession NP_852668.1) is another GAM96 target gene, herein designated TARGET GENE. NAT5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NAT5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAT5 BINDING SITE, designated SEQ ID:13542, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16737] Another function of GAM96 is therefore inhibition of N-acetyltransferase 5 (ard1 homolog, s. cerevisiae) (NAT5, Accession NP_852668.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAT5.

[16738] N-acetyltransferase 5 (ard1 homolog, s. cerevisiae) (NAT5, Accession NP_057184.1) is another GAM96 target gene,

herein designated TARGET GENE. NAT5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NAT5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAT5 BINDING SITE, designated SEQ ID:13542, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16739] Another function of GAM96 is therefore inhibition of N-acetyltransferase 5 (ard1 homolog, s. cerevisiae) (NAT5, Accession NP_057184.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAT5.

[16740] N-acetyltransferase 5 (ard1 homolog, s. cerevisiae) (NAT5, Accession NP_852669.1) is another GAM96 target gene, herein designated TARGET GENE. NAT5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NAT5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAT5 BINDING SITE, designated SEQ ID:13542, to the nu-

cleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16741] Another function of GAM96 is therefore inhibition of N-acetyltransferase 5 (ard1 homolog, s. cerevisiae) (NAT5, Accession NP_852669.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAT5.

[16742] Nadph oxidase 1 (NOX1, Accession NP_008983.1) is another GAM96 target gene, herein designated TARGET GENE. NOX1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by NOX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NOX1 BINDING SITE, designated SEQ ID:13865, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16743] Another function of GAM96 is therefore inhibition of Nadph oxidase 1 (NOX1, Accession NP_008983.1), a gene which mediates the h+ currents of resting phagocytes and other tissues. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with NOX1.

[16744] The function of NOX1 has been established by previous studies. Voltage- gated proton (hydrogen) channels play an important role in cellular defense against acidic stress. They are unique among ion channels with respect to their extremely high selectivity, marked temperature dependence, and unitary conductance, which is 3 orders of magnitude lower than that of most other ion channels. Starace et al. (1997) demonstrated that arginine- to- histidine mutations were sufficient to turn the voltage sensor of the Shaker K+ channel (see OMIM Ref. No. 176260) into a voltage- gated H+ conductance. The critical residues are reminiscent of a motif within the predicted third transmembrane domain of gp91- phox, the electron- transporting subunit of the phagocyte NADPH oxidase encoded by the CYBB gene (OMIM Ref. No. 306400). When NOH1S was stably expressed in HEK293 cells by Banfi et al. (2000), it generated voltage- dependent, outward H+ currents. The currents activated slowly upon depolarization, and several seconds were required to elicit maximal amplitude, as expected for voltage- dependent H+ currents of epithelial cells and phagocytes. The NOH1S currents were reversibly blocked by zinc, a known H+ channel in-

hibitor. Banfi et al. (2000) argued that the fact that NOH1S does not contain an electron transport chain suggests that H+ conductance is its main physiologic function, whereas flavocytochromes such as NOH1L or gp91- phox might conduct H+ ions as part of their electron transport mechanism.

[16745]

[16746] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16747] Banfi, B.; Maturana, A.; Jaconi, S.; Arnaudeau, S.; Laforge, T.; Sinha, S.; Ligeti, E.; Demaurex, N.; Krause, K.- H. : A mammalian H+ channel generated through alternative splicing of the NADPH oxidase homolog NOH- 1. Science 287: 138- 141, 2000. ; and

[16748] Starace, D. M; Stefani, E.; Bezanilla, F. : Voltage- dependent proton transport by the voltage sensor of the Shaker K+ channel. Neuron 19: 1319- 1327, 1997.

[16749] Further studies establishing the function and utilities of NOX1 are found in John Hopkins OMIM database record ID 300225, and in cited publications listed in Table 5, which are hereby incorporated by reference.Neurotensin receptor 2 (NTSR2, Accession NP_036476.1) is another GAM96

target gene, herein designated TARGET GENE. NTSR2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NTSR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NTSR2 BINDING SITE, designated SEQ ID:3637, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16750] Another function of GAM96 is therefore inhibition of Neurotensin receptor 2 (NTSR2, Accession NP_036476.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTSR2.

[16751] 2'-5'-oligoadenylate synthetase 3, 100kda (OAS3, Accession NP_006178.1) is another GAM96 target gene, herein designated TARGET GENE. OAS3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OAS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OAS3 BINDING SITE, designated SEQ ID:12448, to the nucleotide sequence of GAM96 RNA,

herein designated GAM RNA, also designated SEQ ID:394.

[16752] Another function of GAM96 is therefore inhibition of 2'-5'-oligoadenylate synthetase 3, 100kda (OAS3, Accession NP_006178.1), a gene which may play a role in mediating resistance to virus infection, control of cell growth, differentiation, and apoptosis. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAS3.

[16753] The function of OAS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.P15RS (Accession NP_060640.2) is another GAM96 target gene, herein designated TARGET GENE. P15RS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by P15RS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P15RS BINDING SITE, designated SEQ ID:11233, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16754] Another function of GAM96 is therefore inhibition of P15RS (Accession NP_060640.2) . Accordingly, utilities of

GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P15RS.

[16755] Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), alpha polypeptide i (P4HA1, Accession NP_000908.1) is another GAM96 target gene, herein designated TARGET GENE. P4HA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by P4HA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P4HA1 BINDING SITE, designated SEQ ID:3572, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16756] Another function of GAM96 is therefore inhibition of Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), alpha polypeptide i (P4HA1, Accession NP_000908.1), a gene which catalyzes the formation of 4-hydroxyproline in collagen. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P4HA1.

[16757] The function of P4HA1 has been established by previous studies. Prolyl 4- hydroxylase (EC 1.14.11.2) plays a cen-

tral role in collagen synthesis. It catalyzes the formation of 4- hydroxyproline in collagens by hydroxylation of proline residues in peptide linkages. The 4- hydroxyproline residues are essential for the folding of the newly synthesized procollagen polypeptide chain into triple helical molecules. The active enzyme is a tetramer of 2 alpha and 2 beta subunits with a molecular weight of about 240,000. The beta subunit (P4HB; 176790) is identical to the enzyme disulfide isomerase (EC 5.3.4.1) and a major cellular thyroid- binding protein. The alpha subunit probably contributes a major part of the catalytic site of the enzyme. Helaakoski et al. (1989) isolated cDNA clones for the alpha subunit. They found that the clones encode a polypeptide of 517 amino acid residues and a signal peptide of 17 amino acids. Southern blot analyses of human genomic DNA with a cDNA probe for the alpha subunit suggested the presence of only 1 gene encoding 2 types of mRNA, which appear to result from mutually exclusive alternative splicing of primary transcripts of 1 gene. Helaakoski et al. (1994) reported that the P4HA gene covers more than 69 kilobases and consists of 16 exons. Evidence had previously been presented for a mutually exclusive alternative splicing of RNA transcripts of the gene.

The present data indicated that the mutually exclusive sequences found in the mRNAs are coded by 2 consecutive, homologous 71- bp exons, 9 and 10. These exons are identical in their first 5 basepairs and the overall identity between them is 61% at the nucleotide level and 58% at the level of the coded amino acids. Both types of mRNA were found to be expressed in all of the tissues studied, but in some tissues the type coding for the exon 9 or exon 10 sequences was more abundant than the other type.

[16758]

[16759] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16760] Helaakoski, T.; Vuori, K.; Myllyla, R.; Kivirikko, K. I.; Pihlajaniemi, T. : Molecular cloning of the alpha- subunit of human prolyl 4- hydroxylase: the complete cDNA- derived amino acid sequence and evidence for alternative splicing of RNA transcripts. Proc. Nat. Acad. Sci. 86: 4392- 4396, 1989. ; and

[16761] Helaakoski, T.; Veijola, J.; Vuori, K.; Rehn, M.; Chow, L. T.; Taillon- Miller, P.; Kivirikko, K. I.; Pihlajaniemi, T. : Structure and expression of the human gene for the alpha sub-

unit.

[16762] Further studies establishing the function and utilities of P4HA1 are found in John Hopkins OMIM database record ID 176710, and in cited publications listed in Table 5, which are hereby incorporated by reference.Poly(a) binding protein, cytoplasmic 1 (PABPC1, Accession NP_002559.1) is another GAM96 target gene, herein designated TARGET GENE. PABPC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PABPC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PABPC1 BINDING SITE, designated SEQ ID:18105, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16763] Another function of GAM96 is therefore inhibition of Poly(a) binding protein, cytoplasmic 1 (PABPC1, Accession NP_002559.1), a gene which involves in cytoplasmic regulatory processes of mRNA metabolism. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PABPC1.

[16764] The function of PABPC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.2.Phosphoribosylaminoimidazole carboxylase, phosphoribosylaminoimidazole succinocarboxamide synthetase (PAICS, Accession NP_006443.1) is another GAM96 target gene, herein designated TARGET GENE. PAICS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PAICS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAICS BINDING SITE, designated SEQ ID:1992, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16765] Another function of GAM96 is therefore inhibition of Phosphoribosylaminoimidazole carboxylase, phosphoribosylaminoimidazole succinocarboxamide synthetase (PAICS, Accession NP_006443.1), a gene which is required for purine biosynthesis. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAICS.

[16766] The function of PAICS has been established by previous

studies. Schild et al. (1990) used the functional complementation of mutations in Saccharomyces cerevisiae to isolate a human cDNA clone complementing the ade- 2 (phosphoribosylaminoimidazole carboxylase; EC 4.1.1.21) yeast mutation. The same cDNA also complemented ade- 1 (phosphoribosylaminoimidazole succinocarboxamide synthetase; EC 6.3.2.6); thus, this is a bifunctional enzyme. Although these enzymes are encoded by genes on different chromosomes in yeast, their enzymatic activities copurify from chicken livers, and the complementation of both activities by this single cDNA clone suggests that the enzyme is bifunctional in humans. Barton et al. (1991) mapped the gene to chromosome 4 by fusing Chinese hamster ovary (CHO) cells carrying the Ade(-)D mutation with human lymphocytes using inactivated Sendai virus. Two of the isolated subclones contained only the long arm of human chromosome 4 translocated onto a CHO chromosome, thus providing evidence that the gene in question is on 4q. By subjecting 2 of the subclones containing chromosome 4 to BrdU visible light segregation, Barton et al. (1991) demonstrated that all of the isolated purine auxotrophic cell lines showed a loss of 4q. It is noteworthy that this bifunctional enzyme maps to the same gen-

eral region as the monofunctional enzyme PPAT (OMIM Ref. No. 172450), which catalyzes the first step in the biosynthetic pathway for the production of AMP from phosphoribosylpyrophosphate (PRPP) and maps to 4pter-q21. AIR carboxylase (EC 4.1.1.21)/SAICAR synthetase (EC 6.3.2.6) is a bifunctional enzyme, the activities of which are required for steps 6 and 7, respectively, of purine biosynthesis. Brayton et al. (1994) demonstrated that in the human, as in the chicken, the GPAT gene (OMIM Ref. No. 172450), which catalyzes the first and presumably rate- limiting reaction in purine biosynthesis, is closely linked and divergently transcribed. The intergenic region is approximately 625 bp in the human and 229 bp in the chicken. Although there are several examples for bidirectional transcription in higher eukaryotes, GPAT- AIRC was the first example for bidirectional transcription of tightly coupled genes that are not structurally related but are involved in the same pathway. This may be a eukaryotic equivalent of a prokaryotic operon.

[16767]

[16768] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16769] Schild, D.; Brake, A. J.; Kiefer, M. C.; Young, D.; Barr, P. J. : Cloning of three human multifunctional de novo purine biosynthetic genes by functional complementation of yeast mutations. Proc. Nat. Acad. Sci. 87: 2916- 2920, 1990. ; and

[16770] Brayton, K. A.; Chen, Z.; Zhou, G.; Nagy, P. L.; Gavalas, A.; Trent, J. M.; Deaven, L. L.; Dixon, J. E.; Zalkin, H. : Two genes for de novo purine nucleotide synthesis on human chromosom.

[16771] Further studies establishing the function and utilities of PAICS are found in John Hopkins OMIM database record ID 172439, and in cited publications listed in Table 5, which are hereby incorporated by reference.Poly(rc) binding protein 4 (PCBP4, Accession NP_065151.1) is another GAM96 target gene, herein designated TARGET GENE. PCBP4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCBP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCBP4 BINDING SITE, designated SEQ ID:2715, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16772] Another function of GAM96 is therefore inhibition of Poly(rc) binding protein 4 (PCBP4, Accession NP_065151.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP4.

[16773] Poly(rc) binding protein 4 (PCBP4, Accession NP_127502.1) is another GAM96 target gene, herein designated TARGET GENE. PCBP4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCBP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCBP4 BINDING SITE, designated SEQ ID:2715, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16774] Another function of GAM96 is therefore inhibition of Poly(rc) binding protein 4 (PCBP4, Accession NP_127502.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP4.

[16775] Poly(rc) binding protein 4 (PCBP4, Accession NP_127501.1) is another GAM96 target gene, herein des-

ignated TARGET GENE. PCBP4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCBP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCBP4 BINDING SITE, designated SEQ ID:2715, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16776] Another function of GAM96 is therefore inhibition of Poly(rc) binding protein 4 (PCBP4, Accession NP_127501.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP4.

[16777] Poly(rc) binding protein 4 (PCBP4, Accession NP_127503.1) is another GAM96 target gene, herein designated TARGET GENE. PCBP4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCBP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCBP4 BINDING SITE, designated SEQ ID:2715, to the nucleotide

sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16778] Another function of GAM96 is therefore inhibition of Poly(rc) binding protein 4 (PCBP4, Accession NP_127503.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP4.

[16779] Protocadherin alpha 9 (PCDHA9, Accession NP_054724.1) is another GAM96 target gene, herein designated TARGET GENE. PCDHA9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCDHA9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:7481, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16780] Another function of GAM96 is therefore inhibition of Protocadherin alpha 9 (PCDHA9, Accession NP_054724.1), a gene which is a calcium- dependent cell- adhesion protein. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with PCDHA9.

[16781] The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Pyruvate dehydrogenase kinase, isoenzyme 2 (PDK2, Accession NP_002602.2) is another GAM96 target gene, herein designated TARGET GENE. PDK2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDK2 BINDING SITE, designated SEQ ID:7892, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16782] Another function of GAM96 is therefore inhibition of Pyruvate dehydrogenase kinase, isoenzyme 2 (PDK2, Accession NP_002602.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDK2.

[16783] Paternally expressed 10 (PEG10, Accession NP_055883.1) is another GAM96 target gene, herein designated TARGET GENE. PEG10 BINDING SITE is a target binding site found

in the 3` untranslated region of mRNA encoded by PEG10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:11113, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16784] Another function of GAM96 is therefore inhibition of Paternally expressed 10 (PEG10, Accession NP_055883.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10.

[16785] 6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 4 (PFKFB4, Accession NP_004558.1) is another GAM96 target gene, herein designated TARGET GENE. PFKFB4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PFKFB4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PFKFB4 BINDING SITE, designated SEQ ID:10430, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16786] Another function of GAM96 is therefore inhibition of 6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 4 (PFKFB4, Accession NP_004558.1), a gene which catalizes synthesis and degradation of fructose 2,6- bisphosphate. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFKFB4.

[16787] The function of PFKFB4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Polymeric immunoglobulin receptor (PIGR, Accession NP_002635.2) is another GAM96 target gene, herein designated TARGET GENE. PIGR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIGR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIGR BINDING SITE, designated SEQ ID:20111, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16788] Another function of GAM96 is therefore inhibition of Polymeric immunoglobulin receptor (PIGR, Accession

NP_002635.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGR.

[16789] Phosphatidylinositol-4-phosphate 5-kinase, type ii, beta (PIP5K2B, Accession NP_619632.1) is another GAM96 target gene, herein designated TARGET GENE. PIP5K2B BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PIP5K2B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIP5K2B BINDING SITE, designated SEQ ID:18234, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16790] Another function of GAM96 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, type ii, beta (PIP5K2B, Accession NP_619632.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K2B.

[16791] Phosphatidylinositol-4-phosphate 5-kinase, type ii, beta (PIP5K2B, Accession NP_003550.1) is another GAM96 target gene, herein designated TARGET GENE. PIP5K2B BINDING SITE is a target binding site found in the 5` untrans-

lated region of multiple transcripts of mRNA encoded by PIP5K2B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIP5K2B BINDING SITE, designated SEQ ID:18234, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16792] Another function of GAM96 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, type ii, beta (PIP5K2B, Accession NP_003550.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K2B.

[16793] Pbx/knotted 1 homeobox 1 (PKNOX1, Accession NP_004562.2) is another GAM96 target gene, herein designated TARGET GENE. PKNOX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PKNOX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PKNOX1 BINDING SITE, designated SEQ ID:12842, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16794] Another function of GAM96 is therefore inhibition of Pbx/knotted 1 homeobox 1 (PKNOX1, Accession NP_004562.2), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKNOX1.

[16795] The function of PKNOX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.1.Phospholipase a2, group iva (cytosolic, calcium-dependent) (PLA2G4A, Accession NP_077734.1) is another GAM96 target gene, herein designated TARGET GENE. PLA2G4A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLA2G4A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLA2G4A BINDING SITE, designated SEQ ID:11581, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16796] Another function of GAM96 is therefore inhibition of Phospholipase a2, group iva (cytosolic, calcium-dependent) (PLA2G4A, Accession NP_077734.1), a gene which

catalyzes the release of arachidonic acid from membrane phospholipids. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G4A.

[16797] The function of PLA2G4A has been established by previous studies. Cytosolic phospholipase A2 (PLA2; EC 3.1.1.4) catalyzes the release of arachidonic acid from membrane phospholipids. Arachidonic acid in turn serves as precursor for a wide spectrum of biologic effectors, collectively known as eicosanoids, that are involved in hemodynamic regulation, inflammatory responses, and other cellular processes. Dennis (1994) reviewed various types of PLA2. The best characterized is the group II PLA2 originally isolated from human synovial fluid (i.e., PLA2G2A; 172411). Groups I (human pancreatic, PLA2G1B (OMIM Ref. No. 172410); also found in cobras and kraits), II (synovial; also found in rattlesnakes and vipers), and III (forms of which were described in bee and lizard) are secreted; group IV is cytosolic. Cytosolic phospholipase A2 described here (see OMIM Ref. No. GenBank AF065216) is distinct from the synovial phospholipase A2 (PLA2G2A; 172411); it has a large molecular weight; is DTT- insensitive; is activated at a nanomolar to micromolar calcium

concentration range, which prevails in the cytosol; and is arachidonic acid- specific at the sn- 2 position (Skorecki, 1995). PLA2B, the synovial phospholipase A2 described by Seilhamer et al. (1989), is a small molecular weight enzyme that is DTT- sensitive. PLA2B is secreted from cells, active in the micromolar to millimolar calcium concentration range that prevails in the extracellular medium, and active in inflammatory exudates. Sharp et al. (1991) amplified PLA2G4A by PCR with human U937 monoblast cells, using degenerate primers designed from the purified sequenced protein. They cloned PLA2G4 cDNA from a U937 library screened with the PCR product. The deduced 749- amino acid protein has a predicted molecular mass of 85 kD and contains several potential PKC and tyrosine kinase phosphorylation sites. Northern blot analysis detected an approximately 3- kb transcript in U937 cells. Western blot analysis of U937 cells revealed that PLA2G4 migrates with an apparent molecular mass of 100 kD. Tay et al. (1995) mapped the PLA2G4A gene to rat chromosome 13 by PCR- based intercross genotyping and to human 1q25 by fluorescence in situ hybridization. The gene encoding the enzyme prostaglandin- endoperoxide synthase- 2, also known as cyclooxygenase- 2 (PTGS2;

600262), had previously been mapped to the same chromosomal region, raising the possibility of coordinate regulation. PTGS2 is downstream of cytosolic phospholipase A2 in the biochemical pathway for eicosanoid production.

[16798]

[16799] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16800] Dennis, E. A. : Diversity of group types, regulation, and function of phospholipase A2. J. Biol. Chem. 269: 13057-13060, 1994. ; and

[16801] Tay, A.; Simon, J. S.; Squire, J.; Hamel, K.; Jacob, H. J.; Skorecki, K. : Cytosolic phospholipase A2 gene in human and rat: chromosomal localization and polymorphic markers. Genomics 26.

[16802] Further studies establishing the function and utilities of PLA2G4A are found in John Hopkins OMIM database record ID 600522, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pleiomorphic adenoma gene-like 1 (PLAGL1, Accession NP_006709.2) is another GAM96 target gene, herein designated TARGET GENE. PLAGL1 BINDING SITE is a target binding site found in the 5` untranslated region of

multiple transcripts of mRNA encoded by PLAGL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLAGL1 BINDING SITE, designated SEQ ID:15766, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16803] Another function of GAM96 is therefore inhibition of Pleiomorphic adenoma gene-like 1 (PLAGL1, Accession NP_006709.2), a gene which regulates apoptosis and cell cycle arrest. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL1.

[16804] The function of PLAGL1 has been established by previous studies. Cell proliferation is regulated through connected molecular pathways controlling cell division, differentiation, growth arrest, and apoptosis. A tight control of these events is necessary to the maintenance of homeostasis from development to senescence and involves multiple genes. Dysregulation of some of these genes can lead to pathologic situations such as neurodegenerative disorders, immunodeficiency syndromes, and cancer. Early studies on tumor development focused on oncogenes, the

genes whose gain of function leads to enhanced cell growth. The inactivation of a tumor suppressor gene, in contrast, can contribute to the growth deregulation of a tumor cell. This tumor suppressor gene inactivation can occur through a loss- of- function mutation accompanied by a loss of heterozygosity, homozygous deletion, or epi-genetic mechanisms. Several lines of evidence suggest a tumor suppressor function to a candidate gene: involve-ment in familial predisposition to cancer, inactivation in human tumors, tumor formation in null- mutant mice, and functional properties compatible with a role in cell proliferation or development. The candidates in which all of these criteria had been fulfilled include p53 (OMIM Ref. No. 191170), RB (OMIM Ref. No. 180200), p16 (OMIM Ref. No. 600160), and VHL (OMIM Ref. No. 193300). Spengler et al. (1997) isolated a novel mouse gene, designated Zac, which encodes a protein with 7 zinc fingers of the C2H2 type that is only distantly related to previously isolated zinc finger proteins and that inhibits tumor cell prolifera-tion in vitro and in vivo in nude mice. They showed that these antiproliferative properties ensued from the regula-tion of 2 pathways critical to the activity of p53, i.e., cell cycle progression and apoptosis. Thus, mouse Zac was the

first gene unrelated to p53 that was found to regulate these 2 fundamental genetic programs. The authors hypothesized that Zac also could share with p53 its tumor suppressor activity and isolated the human homolog of Zac to investigate its putative tumor suppressor function. They found that human ZAC is a widely expressed zinc finger protein that shows transactivation and DNA- binding activities. Furthermore, like its mouse counterpart and p53, ZAC inhibits tumor cell proliferation through the induction of both apoptosis and cell cycle arrest. Kamiya et al. (2000) described a screen for new imprinted human genes, and in this way identified the ZAC/PLAGL1 gene as a strong candidate for transient neonatal diabetes mellitus (TNDM; 601410). To screen for imprinted genes, they compared parthenogenetic DNA from a chimeric patient FD and androgenetic DNA from hydatidiform mole, using restriction landmark genome scanning for methylation. This resulted in identification of 2 novel imprinted loci, one of which (NV149) mapped to the TNDM region of 6q24. From analysis of the corresponding genomic region, it was determined that NV149 lies approximately 60 kb upstream of the ZAC/PLAGL1 gene. RT- PCR analysis was used to confirm that the ZAC/PLAGL1 gene is ex-

pressed only from the paternal allele in a variety of tissues. TNDM is known to result from upregulation of a paternally expressed gene on 6q24. Kamiya et al. (2000) pointed to the paternal expression, map position, and known biologic properties of ZAC/PLAGL1 as making it highly likely that it is the TNDM gene. In particular, ZAC/PLAGL1 is a transcriptional regulator of the type 1 receptor for pituitary adenylate cyclase- activating polypeptide (OMIM Ref. No. 102981), which is the most potent known insulin secretagogue and an important mediator of autocrine control of insulin secretion in the pancreatic islet.

[16807] Spengler, D.; Villalba, M.; Hoffmann, A.; Pantaloni, C.; Houssami, S.; Bockaert, J.; Journot, L. : Regulation of apoptosis and cell cycle arrest by Zac1, a novel zinc finger protein expressed in the pituitary gland and the brain. EMBO J. 16: 2814- 2825, 1997. ; and

[16808] Kamiya, M.; Judson, H.; Okazaki, Y.; Kusakabe, M.; Muramatsu, M.; Takada, S.; Takagi, N.; Arima, T.; Wake, N.; Kamimura, K.; Satomura, K.; Hermann, R.; Bonthron, D. T.;

Hayashizaki, Y. :.

[16809] Further studies establishing the function and utilities of PLAGL1 are found in John Hopkins OMIM database record ID 603044, and in cited publications listed in Table 5, which are hereby incorporated by reference.Proteolipid protein 1 (pelizaeus-merzbacher disease, spastic paraplegia 2, uncomplicated) (PLP1, Accession NP_000524.2) is another GAM96 target gene, herein designated TARGET GENE. PLP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLP1 BINDING SITE, designated SEQ ID:7068, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16810] Another function of GAM96 is therefore inhibition of Proteolipid protein 1 (pelizaeus-merzbacher disease, spastic paraplegia 2, uncomplicated) (PLP1, Accession NP_000524.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLP1.

[16811] Paired mesoderm homeo box 1 (PMX1, Accession

NP_073207.1) is another GAM96 target gene, herein designated TARGET GENE. PMX1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PMX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PMX1 BINDING SITE, designated SEQ ID:2960, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16812] Another function of GAM96 is therefore inhibition of Paired mesoderm homeo box 1 (PMX1, Accession NP_073207.1), a gene which acts as a transcriptional regulator of muscle creatine kinase. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX1.

[16813] The function of PMX1 has been established by previous studies. Homeo box genes are expressed in specific temporal and spatial patterns and function as transcriptional regulators of developmental processes. The murine homeo box gene Pmx (paired mesoderm homeo box), previously called K- 2 and mHox, is expressed in a mesodermally restricted pattern in embryos and most abun-

dantly in cardiac, skeletal, and smooth muscle tissues in adults (Kern et al., 1994). Grueneberg et al. (1992) cloned the homologous human gene. By means of interspecific backcross analysis, Kern et al. (1994) determined that the Pmx gene is located on mouse chromosome 1, approximately 3.3 cM distal to the Gsh- 4 homeo box locus. The gene contains at least 5 exons spanning a minimum of 60 kb of genomic DNA, making this the largest known murine homeo box gene. The homologous human gene may map to 1q inasmuch as this region is syntenic with the region of mouse chromosome 1 where Pmx is located. Norris et al. (2000) mapped the human PRRX1 gene to 1q23 by fluorescence in situ hybridization.

[16814]

[16815] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16816] Grueneberg, D. A.; Natesan, S.; Alexandre, C.; Gilman, M. Z. : Human and Drosophila homeodomain proteins that enhance the DNA- binding activity of serum response factor. Science 257: 1089- 1095, 1992. ; and

[16817] Norris, R. A.; Scott, K. K.; Moore, C. S.; Stetten, G.; Brown, C. R.; Jabs, E. W.; Wulfsberg, E. A.; Yu, J.; Kern, M. J. : Hu-

man PRRX1 and PRRX2 genes: cloning, expression, genomic localiz.

[16818] Further studies establishing the function and utilities of PMX1 are found in John Hopkins OMIM database record ID 167420, and in cited publications listed in Table 5, which are hereby incorporated by reference.Paired mesoderm homeo box 1 (PMX1, Accession NP_008833.1) is another GAM96 target gene, herein designated TARGET GENE. PMX1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PMX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PMX1 BINDING SITE, designated SEQ ID:2960, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16819] Another function of GAM96 is therefore inhibition of Paired mesoderm homeo box 1 (PMX1, Accession NP_008833.1), a gene which acts as a transcriptional regulator of muscle creatine kinase. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX1.

[16820] The function of PMX1 has been established by previous

studies. Homeo box genes are expressed in specific temporal and spatial patterns and function as transcriptional regulators of developmental processes. The murine homeo box gene Pmx (paired mesoderm homeo box), previously called K- 2 and mHox, is expressed in a mesodermally restricted pattern in embryos and most abundantly in cardiac, skeletal, and smooth muscle tissues in adults (Kern et al., 1994). Grueneberg et al. (1992) cloned the homologous human gene. By means of interspecific backcross analysis, Kern et al. (1994) determined that the Pmx gene is located on mouse chromosome 1, approximately 3.3 cM distal to the Gsh- 4 homeo box locus. The gene contains at least 5 exons spanning a minimum of 60 kb of genomic DNA, making this the largest known murine homeo box gene. The homologous human gene may map to 1q inasmuch as this region is syntenic with the region of mouse chromosome 1 where Pmx is located. Norris et al. (2000) mapped the human PRRX1 gene to 1q23 by fluorescence in situ hybridization.

[16821]

[16822] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16823] Grueneberg, D. A.; Natesan, S.; Alexandre, C.; Gilman, M. Z. : Human and Drosophila homeodomain proteins that enhance the DNA- binding activity of serum response factor. Science 257: 1089- 1095, 1992. ; and

[16824] Norris, R. A.; Scott, K. K.; Moore, C. S.; Stetten, G.; Brown, C. R.; Jabs, E. W.; Wulfsberg, E. A.; Yu, J.; Kern, M. J. : Human PRRX1 and PRRX2 genes: cloning, expression, genomic localiz.

[16825] Further studies establishing the function and utilities of PMX1 are found in John Hopkins OMIM database record ID 167420, and in cited publications listed in Table 5, which are hereby incorporated by reference.Polymerase (dna directed) sigma (POLS, Accession NP_008930.1) is another GAM96 target gene, herein designated TARGET GENE. POLS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POLS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POLS BINDING SITE, designated SEQ ID:9961, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16826] Another function of GAM96 is therefore inhibition of Poly-

merase (dna directed) sigma (POLS, Accession NP_008930.1), a gene which is necessary for chromosome segregation. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLS.

[16827] The function of POLS has been established by previous studies. Wang et al. (2000) found that yeast TRF4, an evolutionarily conserved gene necessary for chromosome segregation, encodes a DNA polymerase with beta- polymerase- like properties. A double mutant in the redundant homologs TRF4 and TRF5 is unable to complete S phase, whereas a TRF4 single mutant completes a presumably defective S phase that results in the failure of cohesion between the replicated sister chromatids. This suggested that TRFs are a key link in the coordination between DNA replication and sister chromatid cohesion. Walowsky et al. (1999) noted that a region of the human TRF4- 1 gene is identical to an STS (OMIM Ref. No. G06245) mapping to 5p15. This region of chromosome 5p is among the most common regions amplified in small cell lung tumor cell lines and in primary small cell tumors. In addition, amplifications in this region are frequently found in high- grade ovarian tumors.

[16828]

[16829] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16830] Wang, Z.; Castano, I. B.; De Las Penas, A.; Adams, C.; Christman, M. F. : Pol kappa: a DNA polymerase required for sister chromatid cohesion. Science 289: 774- 779, 2000. ; and

[16831] Walowsky, C.; Fitzhugh, D. J.; Castano, I. B.; Ju, J. Y.; Levin, N. A.; Christman, M. F. : The topoisomerase- related function gene TRF4 affects cellular sensitivity to the antitumor agent.

[16832] Further studies establishing the function and utilities of POLS are found in John Hopkins OMIM database record ID 605198, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein phosphatase 2, regulatory subunit b (b56), delta isoform (PPP2R5D, Accession NP_006236.1) is another GAM96 target gene, herein designated TARGET GENE. PPP2R5D BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPP2R5D, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of PPP2R5D BINDING SITE, designated SEQ ID:19741, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16833] Another function of GAM96 is therefore inhibition of Protein phosphatase 2, regulatory subunit b (b56), delta isoform (PPP2R5D, Accession NP_006236.1), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5D.

[16834] The function of PPP2R5D has been established by previous studies. Protein phosphorylation is a regulatory mechanism commonly employed in cellular processes such as cell cycle progression, growth factor signaling, and cell transformation. Protein phosphatase 2A (PP2A), a heterotrimeric serine/threonine phosphatase, has been implicated in a variety of regulatory processes including cell growth and division, muscle contraction, and gene transcription. PP2A is composed of a 36- kD catalytic subunit (OMIM Ref. No. 176915), a highly homologous 65- kD structural subunit, and any of several different regulatory subunits which control its specificity. According to Mc-

Cright et al. (1996), the B56 family of regulatory subunits is encoded by at least 5 homologous but distinct genes, termed B56- alpha, - beta, - gamma, - delta, and - epsilon. McCright et al. (1996) cloned the B56- delta gene from a human fetal brain cDNA library using a partial cDNA sequence. They found that B56- delta encoded a 602- amino acid protein with a predicted molecular mass of 69,947 Da. This subunit is able to form a functional trimeric PP2A phosphatase when combined with an A and a C subunit.

[16835]

[16836] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16852] McCright, B.; Rivers, A. M.; Audlin, S.; Virshup, D. M. : The B56 family of protein phosphatase 2A (PP2A) regulatory subunits encodes differentiation- induced phosphoproteins that target.

[16853] Further studies establishing the function and utilities of PPP2R5D are found in John Hopkins OMIM database record ID 601646, and in cited publications listed in Table 5, which are hereby incorporated by reference.Prokineticin 1 (PROK1, Accession NP_115790.1) is another GAM96 target gene, herein designated TARGET GENE. PROK1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PROK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PROK1 BINDING SITE, designated SEQ ID:18144, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16854] Another function of GAM96 is therefore inhibition of Prokineticin 1 (PROK1, Accession NP_115790.1), a gene which induces proliferation, migration and fenestration in capillary endothelial cells derived from endocrine glands.

Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROK1.

[16855] The function of PROK1 has been established by previous studies. Endocrine gland- derived vascular endothelial growth factor (EG- VEGF) induces proliferation, migration, and fenestration in capillary endothelial cells derived from endocrine glands. Its expression is induced by hypoxia and is restricted to the steroidogenic glands (ovary, testis, adrenal, and placenta). Its expression is often complementary to the expression of VEGF (OMIM Ref. No. 192240), suggesting that these molecules function in a coordinated manner. LeCouter et al. (2001) screened a library of purified human secreted proteins for the ability to induce proliferation in primary bovine adrenal cortex- derived capillary endothelial cells. EG- VEGF was capable of inducing a strong and reproducible mitogenic response. Mature EG- VEGF is a protein with a relative molecular mass of 8,600 encoded by a cDNA cloned from human ovary library. The 1.4- kb cDNA encodes a protein of 105 amino acids with a well defined signal sequence. The mature protein is predicted to have 86 amino acids, including 10 cysteines, and an expected isoelectric point of 8.46.

These cysteines potentially form 5 disulfide bridges. EG-VEGF displays a high degree of homology to a nontoxic protein purified from the venom of the black mamba snake, venom protein A (VPRA). The structure of native VPRA was solved, and the disulfide bridge partners were revealed. The number and spacing of cysteines are completely conserved between VPRA and EG- VEGF. BV8, a human molecule closely related to a peptide isolated from the yellow- bellied toad, is 58% identical to the EG- VEGF mature protein. There is also significant homology to the carboxy- terminal sequence of Xenopus dickkopf (see OMIM Ref. No. 605189) and to colipase (OMIM Ref. No. 120105). Li et al. (2001) identified EG- VEGF as prokineticin- 1. EG- VEGF is mitogenic and chemoattractive and able to induce fenestration. EG- VEGF expression is induced by hypoxia, and there is an HIF1 (OMIM Ref. No. 603348) binding site present on EG- VEGF. EG- VEGF is able to induce angiogenesis and ovarian cyst formation. Northern blot analysis demonstrated expression in testis, ovary, adrenal gland, and placenta. A signal was detectable in prostate after prolonged exposure

[16856]

PXF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PXF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of PXF BINDING SITE, designated SEQ ID:4076, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16861] Another function of GAM96 is therefore inhibition of Peroxisomal farnesylated protein (PXF, Accession NP_002848.1), a gene which may function in peroxisomal biogenesis or assembly and therefore may be associated with Peroxisome biogenesis disorder (pbd). Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of Peroxisome biogenesis disorder (pbd), and of other diseases and clinical conditions associated with PXF.

[16862] The function of PXF has been established by previous studies. The covalent attachment of prenyl lipids, such as farnesyl or geranylgeranyl groups, by specific transferases is indispensable for the cellular sorting of many proteins. James et al. (1994) identified in hamster a farnesylated protein, called peroxisomal farnesylated protein or PxF, that localized to the outer surface of peroxisomes. Kammerer et al. (1997) found that the protein sequence of PxF is 93% identical to that of HK33, a human protein identified by Braun et al. (1994). Braun et al. (1994) reported that HK33 is a predicted 299- amino acid protein with a mass of 33 kD by SDS- PAGE. Northern blot analysis and

RT- PCR revealed that HK33 is expressed ubiquitously as 2.2 to 2.5- kb and 4- kb mRNAs. The fact that the gene was transcribed in all cells and tissues tested indicated its status as a housekeeping gene. Braun et al. (1994) demonstrated that at least 2 different HK33 transcripts result from the use of alternative polyadenylation sites. Kammerer et al. (1997) isolated 4 variant HK33, or PXF, mRNAs produced by alternative splicing. They found that the proteins encoded by 2 of the splice variants were farnesylated in vitro. Using immunoelectron microscopy, Kammerer et al. (1997) showed that PXF is localized to the cytoplasmic surface of peroxisomes in liver cells. These authors reported that the PXF gene contains 8 exons and spans approximately 9 kb. The basal promoter is located within the first 239 bp upstream of the coding region.

[16863]

[16864] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16865] Braun, A.; Kammerer, S.; Weissenhorn, W.; Weiss, E. H.; Cleve, H. : Sequence of a putative human housekeeping gene (HK33) localized on chromosome 1. Gene 146: 291-295, 1994. ; and

[16866] Kammerer, S.; Arnold, N.; Gutensohn, W.; Mewes, H.- W.; Kunau, W.- H.; Hofler, G.; Roscher, A. A.; Braun, A. : Genomic organization and molecular characterization of a gene encoding HsPX.

[16867] Further studies establishing the function and utilities of PXF are found in John Hopkins OMIM database record ID 600279, and in cited publications listed in Table 5, which are hereby incorporated by reference.Peroxisomal membrane protein 3, 35kda (zellweger syndrome) (PXMP3, Accession NP_000309.1) is another GAM96 target gene, herein designated TARGET GENE. PXMP3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PXMP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PXMP3 BINDING SITE, designated SEQ ID:12286, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16868] Another function of GAM96 is therefore inhibition of Peroxisomal membrane protein 3, 35kda (zellweger syndrome) (PXMP3, Accession NP_000309.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with PXMP3.

[16869] Rab22a, member ras oncogene family (RAB22A, Accession NP_065724.1) is another GAM96 target gene, herein designated TARGET GENE. RAB22A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB22A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB22A BINDING SITE, designated SEQ ID:10718, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16870] Another function of GAM96 is therefore inhibition of Rab22a, member ras oncogene family (RAB22A, Accession NP_065724.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB22A.

[16871] Rap1, gtpase activating protein 1 (RAP1GA1, Accession NP_002876.1) is another GAM96 target gene, herein designated TARGET GENE. RAP1GA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAP1GA1, corresponding to a target binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAP1GA1 BINDING SITE, designated SEQ ID:17705, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16872] Another function of GAM96 is therefore inhibition of Rap1, gtpase activating protein 1 (RAP1GA1, Accession NP_002876.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1GA1.

[16873] RASSF5 (Accession NP_113625.1) is another GAM96 target gene, herein designated TARGET GENE. RASSF5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RASSF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASSF5 BINDING SITE, designated SEQ ID:1440, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16874] Another function of GAM96 is therefore inhibition of RASSF5 (Accession NP_113625.1) . Accordingly, utilities of

GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF5.

[16875] RDH-E2 (Accession NP_620419.1) is another GAM96 target gene, herein designated TARGET GENE. RDH-E2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RDH-E2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RDH-E2 BINDING SITE, designated SEQ ID:18476, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16876] Another function of GAM96 is therefore inhibition of RDH-E2 (Accession NP_620419.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDH-E2.

[16877] Renin (REN, Accession XP_085689.1) is another GAM96 target gene, herein designated TARGET GENE. REN BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by REN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of REN BINDING SITE, designated SEQ ID:4098, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16878] Another function of GAM96 is therefore inhibition of Renin (REN, Accession XP_085689.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REN.

[16879] RP42 (Accession NP_065691.1) is another GAM96 target gene, herein designated TARGET GENE. RP42 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RP42, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RP42 BINDING SITE, designated SEQ ID:2138, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16880] Another function of GAM96 is therefore inhibition of RP42 (Accession NP_065691.1), a gene which not clear yet and therefore may be associated with Autism. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of Autism, and of other diseases and clinical

conditions associated with RP42.

[16881] The function of RP42 has been established by previous studies. In a systematic search for genes expressed in proliferating neuroblasts whose human orthologs map to susceptibility loci for autism (OMIM Ref. No. 209850), Mas et al. (2000) isolated a novel mouse gene, which they designated RP42. They obtained the human homolog by combining contigs of human ESTs and RT- PCR of human embryonic mRNAs. The deduced human and mouse RP42 proteins contain 259 amino acids and differ by only 2 residues. They show 30 to 36% overall sequence identity to an S. pombe and a C. elegans protein, suggesting that the RP42 protein has an important cellular function. Northern blot analysis in the mouse embryo demonstrated expression of 2 transcripts, with the larger transcript reaching peak expression from E11 to E15, and the smaller transcript showing high expression from E7 to E15, indicating developmentally regulated expression, which was found particularly in proliferating neuroblasts. In mouse adult tissues, 3 transcripts were expressed in testis, kidney, liver, skeletal muscle, and heart, with weaker expression in brain. Northern blot analysis of adult human tissues detected 2 RP42 transcripts of approxi-

mately 3.7 and 2.7 kb at lower levels of expression than in mouse. RT- PCR showed that RP42 is expressed in the human embryo telencephalon Mas et al. (2000) identified the human RP42 sequence in a cluster of embryonic neuronally expressed genes on a PAC mapping to 6q16, making it a candidate gene for the susceptibility autism locus previously assigned to this region

[16882]

[16883] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16884] Mas, C.; Bourgeois, F.; Bulfone, A.; Levacher, B.; Mugnier, C.; Simonneau, M. : Cloning and expression analysis of a novel gene, RP42, mapping to an autism susceptibility locus on 6q16. Genomics 65: 70- 74, 2000. ; and

[16885] Mas, C.; Bourgeois, F.; Bulfone, A.; Levacher, B.; Mugnier, C.; Simonneau, M. : Cloning and expression analysis of a novel gene, RP42, mapping to an autism susceptibility locus on 6q16. Ge.

[16886] Further studies establishing the function and utilities of RP42 are found in John Hopkins OMIM database record ID 605905, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sodium channel,

voltage-gated, type v, alpha polypeptide (long (electrocardiographic) qt syndrome 3) (SCN5A, Accession NP_000326.2) is another GAM96 target gene, herein designated TARGET GENE. SCN5A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCN5A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCN5A BINDING SITE, designated SEQ ID:18915, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16887] Another function of GAM96 is therefore inhibition of Sodium channel, voltage-gated, type v, alpha polypeptide (long (electrocardiographic) qt syndrome 3) (SCN5A, Accession NP_000326.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN5A.

[16888] SEC61B (Accession NP_006799.1) is another GAM96 target gene, herein designated TARGET GENE. SEC61B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEC61B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of SEC61B BINDING SITE, designated SEQ ID:9649, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16889] Another function of GAM96 is therefore inhibition of SEC61B (Accession NP_006799.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC61B.

[16890] Sh3-domain binding protein 2 (SH3BP2, Accession NP_003014.2) is another GAM96 target gene, herein designated TARGET GENE. SH3BP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SH3BP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SH3BP2 BINDING SITE, designated SEQ ID:1516, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16891] Another function of GAM96 is therefore inhibition of Sh3-domain binding protein 2 (SH3BP2, Accession NP_003014.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SH3BP2.

[16892] Solute carrier family 4, sodium bicarbonate cotransporter, member 4 (SLC4A4, Accession NP_003750.1) is another GAM96 target gene, herein designated TARGET GENE. SLC4A4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC4A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC4A4 BINDING SITE, designated SEQ ID:12800, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16893] Another function of GAM96 is therefore inhibition of Solute carrier family 4, sodium bicarbonate cotransporter, member 4 (SLC4A4, Accession NP_003750.1), a gene which is a sodium bicarbonate cotransporter and therefore may be associated with Proximal renal tubular acidosis, mental retardation, and bilateral glaucoma, cataracts, and band keratopathy. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of Proximal renal tubular acidosis, mental retardation, and bilateral glaucoma, cataracts, and band keratopathy, and of other diseases and clinical conditions associated with SLC4A4.

[16894] The function of SLC4A4 has been established by previous studies. By screening a human heart cDNA library with rat kidney Nbc cDNAs, followed by a PCR approach, Choi et al. (1999) isolated a full- length cDNA encoding a heart NBC, which they called hhNBC. They reported that the coding sequence of hhNBC is identical to that of pNBC (Abuladze et al., 1998). However, the 5- prime untranslated regions of hhNBC and pNBC differ. Northern blot analysis using the 5- prime region of the hhNBC coding sequence as probe detected an approximately 9- kb transcript that was strongly expressed in pancreas and weakly expressed in heart and brain. Choi et al. (1999) found that both hhNBC and kNBC (Burnham et al., 1997), when expressed in Xenopus, are electrogenic. Soleimani and Burnham (2000) stated that kNBC (Burnham et al., 1997) and pNBC (Abuladze et al., 1998) are encoded by splice variants of the same gene, SLC4A4, which they called NBC1. Mutations in the SLC4A4 gene (e.g., 603345.0001, 603345.0002) cause proximal renal tubular acidosis with bilateral glaucoma, cataracts, and band keratopathy (OMIM Ref. No. 604278). Such mutations may increase the bicarbonate concentration in the corneal stroma, which would facilitate calcium deposition leading to band ker-

atopathy. Igarashi et al. (1999) suggested that the kidney and pancreatic NBCs are derived from a common gene by alternative splicing and that mutations at the common region would inactivate both isoforms. Studies by Usui et al. (1999) confirmed that both kidney and pancreatic NBC are involved in the transport of sodium and bicarbonate out of the corneal stroma and into the aqueous humor.

[16895]

[16896] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16897] Soleimani, M.; Burnham, C. E. : Physiologic and molecular aspects of the Na(+):HCO(3-) cotransporter in health and disease processes. Kidney Int. 57: 371- 384, 2000. ; and

[16898] Choi, I.; Romero, M. F.; Khandoudi, N.; Bril, A.; Boron, W. F. : Cloning and characterization of a human electrogenic Na(+)- HCO(3-) cotransporter isoform (hhNBC). Am. J. Physiol. 276: C57.

[16899] Further studies establishing the function and utilities of SLC4A4 are found in John Hopkins OMIM database record ID 603345, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 5 (sodium-dependent vitamin transporter), member

6 (SLC5A6, Accession NP_066918.1) is another GAM96 target gene, herein designated TARGET GENE. SLC5A6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC5A6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC5A6 BINDING SITE, designated SEQ ID:10988, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16900] Another function of GAM96 is therefore inhibition of Solute carrier family 5 (sodium-dependent vitamin transporter), member 6 (SLC5A6, Accession NP_066918.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC5A6.

[16901] SLC5A8 (Accession NP_666018.1) is another GAM96 target gene, herein designated TARGET GENE. SLC5A8 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC5A8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC5A8

BINDING SITE, designated SEQ ID:7461, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16902] Another function of GAM96 is therefore inhibition of SLC5A8 (Accession NP_666018.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC5A8.

[16903] Sp3 transcription factor (SP3, Accession XP_092672.2) is another GAM96 target gene, herein designated TARGET GENE. SP3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SP3 BINDING SITE, designated SEQ ID:18315, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16904] Another function of GAM96 is therefore inhibition of Sp3 transcription factor (SP3, Accession XP_092672.2), a gene which binds to gt and gc boxes promoters elements. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP3.

[16905] The function of SP3 has been established by previous studies. Kingsley and Winoto (1992) noted that in T cells, a consensus GT box similar to the GC box is bound by Sp1. Gel shift analysis showed that other regulatory proteins also bind the GT box. They then cloned 2 novel cDNAs using the Sp1 zinc finger domain as a probe. These new transcription factors, termed Sp2 (OMIM Ref. No. 601801) and Sp3 by them, encode proteins with several transactivation domains and a zinc finger DNA- binding domain with homology to Sp1. The Sp3 cDNA encodes an open reading frame of 713 amino acids. They found that the amino acid sequence of Sp3 is 90% homologous to that of Sp1 within the zinc finger region, and that there is significant homology throughout the protein. Kingsley and Winoto (1992) found that, when expressed in vitro, both Sp1 and Sp3 bind strongly to GC- and GT- box regulatory elements. Hagen et al. (1992) independently performed recognition site screening for factors which bind to the GT motif of the uteroglobin promoter. They isolated Sp3 and Sp4 (OMIM Ref. No. 600540), referring to them as SPR2 and SPR1 (for Sp- related factors 2 and 1) respectively. Northern blot analysis showed that Sp3 is expressed as a 5.0- kb message in all cell lines and tissues tested. Hagen

et al. (1994) found that Sp3 represses Sp1- mediated transcriptional activation, suggesting that Sp3 is an inhibitory member of the Sp gene family.

[16906]

[16907] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16908] Kalff- Suske, M.; Kunz, J.; Grzeschik, K.- H.; Suske, G. : Human Sp3 transcriptional regulator gene (SP3) maps to chromosome 2q31. Genomics 37: 410- 412, 1996. ; and

[16909] Hagen, G.; Muller, S.; Beato, M.; Suske, G. : Cloning by recognition site screening of two novel GT box binding proteins: a family of Sp1 related genes. Nucleic Acids Res. 20: 5519- 5525, 19.

[16910] Further studies establishing the function and utilities of SP3 are found in John Hopkins OMIM database record ID 415000, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sprouty homolog 3 (drosophila) (SPRY3, Accession NP_005831.1) is another GAM96 target gene, herein designated TARGET GENE. SPRY3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPRY3, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPRY3 BINDING SITE, designated SEQ ID:11554, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16911] Another function of GAM96 is therefore inhibition of Sprouty homolog 3 (drosophila) (SPRY3, Accession NP_005831.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRY3.

[16912] SRP (Accession NP_149976.1) is another GAM96 target gene, herein designated TARGET GENE. SRP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SRP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRP BINDING SITE, designated SEQ ID:1261, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16913] Another function of GAM96 is therefore inhibition of SRP (Accession NP_149976.1), a gene which ligands for the type 2 CRH receptor . Accordingly, utilities of GAM96 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with SRP.

[16914] The function of SRP has been established by previous studies. The stresscopin (SCP; 605901) and stresscopin-related peptide (SRP) genes encode specific ligands for the type 2 CRH receptor (CRHR2; 602034), which mediates stress coping responses during the recovery phase of stress. Hsu and Hsueh (2001) identified human stresscopin (SCP) and stresscopin- related peptide (SRP) as corticotropin- releasing hormone (CRH)/urocortin (OMIM Ref. No. 600945) family members. The 112- amino acid human SRP open reading frame contains a signal peptide for secretion, and the region containing the 43- amino acid mature peptide is flanked by potential proteolytic cleavage sites and an alpha- amidation donor residue. A stretch of 30 residues at the respective carboxy termini of human and pufferfish SRP has an extended alpha- helical structure shared by all CRH family peptides. SRP is expressed in diverse peripheral tissues as well as in the central nervous system. Treatment with stresscopin or stresscopin-related peptide suppressed food intake and delayed gastric emptying in mice and decreased heat- induced edema in rats. Hsu and Hsueh (2001) concluded that SCP and SRP

might represent endogenous ligands for maintaining homeostasis after stress, and could allow the design of drugs to ameliorate stress- related diseases. Reyes et al. (2001) cloned mouse urocortin II, a homolog of human SRP, and a partial cDNA encoding human SRP, which they termed urocortin- related peptide (URP). The mouse and human proteins share 76% amino acid identity. Hybridization histochemistry showed expression in cell groups involved in stress- related physiologic and behavioral functions. By analysis of a BAC clone, Reyes et al. (2001) mapped the SRP gene to chromosome 3p21.3.

[16915]

[16916] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16917] Hsu, S. Y.; Hsueh, A. J. W. : Human stresscopin and stresscopin- related peptide are selective ligands for the type 2 corticotropin- releasing hormone receptor. Nature Med. 7: 605- 611, 2001. ; and

[16918] Reyes, T. M.; Lewis, K.; Perrin, M. H.; Kunitake, K. S.; Vaughan, J.; Arias, C. A.; Hogenesch, J. B.; Gulyas, J.; Rivier, J.; Vale, W. W.; Sawchenko, P. E. : Urocortin II: a member of.

[16919] Further studies establishing the function and utilities of SRP are found in John Hopkins OMIM database record ID 605902, and in cited publications listed in Table 5, which are hereby incorporated by reference.Serine/threonine kinase 23 (STK23, Accession NP_055185.1) is another GAM96 target gene, herein designated TARGET GENE. STK23 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STK23, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STK23 BINDING SITE, designated SEQ ID:7482, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16920] Another function of GAM96 is therefore inhibition of Serine/threonine kinase 23 (STK23, Accession NP_055185.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK23.

[16921] T54 (Accession NP_056513.2) is another GAM96 target gene, herein designated TARGET GENE. T54 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by T54, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of T54 BINDING SITE, designated SEQ ID:8102, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16922] Another function of GAM96 is therefore inhibition of T54 (Accession NP_056513.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with T54.

[16923] T-box 4 (TBX4, Accession NP_060958.2) is another GAM96 target gene, herein designated TARGET GENE. TBX4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TBX4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBX4 BINDING SITE, designated SEQ ID:3489, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16924] Another function of GAM96 is therefore inhibition of T-box 4 (TBX4, Accession NP_060958.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with TBX4.

[16925] Transcription factor-like 5 (basic helix-loop-helix) (TCFL5, Accession NP_006593.1) is another GAM96 target gene, herein designated TARGET GENE. TCFL5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TCFL5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCFL5 BINDING SITE, designated SEQ ID:19813, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16926] Another function of GAM96 is therefore inhibition of Transcription factor-like 5 (basic helix-loop-helix) (TCFL5, Accession NP_006593.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCFL5.

[16927] TIM50L (Accession XP_053074.2) is another GAM96 target gene, herein designated TARGET GENE. TIM50L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TIM50L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIM50L BINDING SITE, designated SEQ ID:12301, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16928] Another function of GAM96 is therefore inhibition of TIM50L (Accession XP_053074.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIM50L.

[16929] Tumor necrosis factor (ligand) superfamily, member 9 (TNFSF9, Accession NP_003802.1) is another GAM96 target gene, herein designated TARGET GENE. TNFSF9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFSF9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFSF9 BINDING SITE, designated SEQ ID:19645, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16930] Another function of GAM96 is therefore inhibition of Tumor necrosis factor (ligand) superfamily, member 9 (TNFSF9, Accession NP_003802.1) . Accordingly, utilities

of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF9.

[16931] Tropomyosin 3 (TPM3, Accession NP_689476.1) is another GAM96 target gene, herein designated TARGET GENE. TPM3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TPM3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TPM3 BINDING SITE, designated SEQ ID:8850, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16932] Another function of GAM96 is therefore inhibition of Tropomyosin 3 (TPM3, Accession NP_689476.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPM3.

[16933] Tripartite motif-containing 31 (TRIM31, Accession NP_438111.1) is another GAM96 target gene, herein designated TARGET GENE. TRIM31 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TRIM31, corresponding to a target binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM31 BINDING SITE, designated SEQ ID:1342, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16934] Another function of GAM96 is therefore inhibition of Tripartite motif-containing 31 (TRIM31, Accession NP_438111.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM31.

[16935] Tripartite motif-containing 31 (TRIM31, Accession NP_008959.2) is another GAM96 target gene, herein designated TARGET GENE. TRIM31 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TRIM31, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM31 BINDING SITE, designated SEQ ID:1342, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16936] Another function of GAM96 is therefore inhibition of Tripartite motif-containing 31 (TRIM31, Accession

NP_008959.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM31.

[16937] Ubiquitin associated protein 2 (UBAP2, Accession NP_680476.1) is another GAM96 target gene, herein designated TARGET GENE. UBAP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UBAP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBAP2 BINDING SITE, designated SEQ ID:11910, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16938] Another function of GAM96 is therefore inhibition of Ubiquitin associated protein 2 (UBAP2, Accession NP_680476.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBAP2.

[16939] Ubiquitously transcribed tetratricopeptide repeat gene, x chromosome (UTX, Accession NP_066963.1) is another GAM96 target gene, herein designated TARGET GENE. UTX BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by UTX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UTX BINDING SITE, designated SEQ ID:7037, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16940] Another function of GAM96 is therefore inhibition of Ubiquitously transcribed tetratricopeptide repeat gene, x chromosome (UTX, Accession NP_066963.1), a gene which contains tetratricopeptide repeat motifs believed to mediate protein- protein interaction. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UTX.

[16941] The function of UTX has been established by previous studies. Greenfield et al. (1996) described a mouse Y-linked gene, Uty (OMIM Ref. No. 400009), which is widely expressed and encodes a tetratricopeptide repeat (TPR) protein. TPR motifs are found in a variety of functionally distinct proteins and are believed to mediate protein-protein interaction. The 5.5- kb Uty transcript encodes a 1,186 amino acid protein with 8 TPR motifs in its N terminus. Greenfield et al. (1998) reported that the human UTY

gene maps to band 5C. This band is known to contain one or more genes functioning in spermatogenesis and a Y-specific growth gene. Greenfield et al. (1998) described the isolation of an X- linked homolog of Uty, called Utx (ubiquitously transcribed TPR gene on the X chromosome), which is expressed from the inactive X chromosome in both mice and humans. The gene maps to the proximal region of the mouse X chromosome in an interval containing the Maoa (OMIM Ref. No. 309850) and Maob (OMIM Ref. No. 309860) genes, thus placing it in band A2- A3. By Southern analysis of a panel of rodent/human somatic cell hybrids carrying derivative X chromosomes, Greenfield et al. (1998) mapped the human UTX gene to Xp11.3- p11.23. By fluorescence in situ hybridization on normal human metaphase spreads, they refined the localization to Xp11.2

[16942]

[16943] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16944] Greenfield, A.; Carrel, L.; Pennisi, D.; Philippe, C.; Quaderi, N.; Siggers, P.; Steiner, K.; Tam, P. P. L.; Monaco, A. P.; Willard, H. F.; Koopman, P. : The UTX gene escapes X in-

activation in mice and humans. Hum. Molec. Genet. 7: 737- 742, 1998. ; and

[16945] Greenfield, A. J.; Scott, D.; Pennisi, D.; Ehrmann, I.; Ellis, P.; Cooper, L.; Simpson, E.; Koopman, P. : An H- YDb epitope is encoded by a novel mouse Y chromosome gene. Nature Genet. 1.

[16946] Further studies establishing the function and utilities of UTX are found in John Hopkins OMIM database record ID 300128, and in cited publications listed in Table 5, which are hereby incorporated by reference.Vang-like 2 (van gogh, drosophila) (VANGL2, Accession XP_049695.4) is another GAM96 target gene, herein designated TARGET GENE. VANGL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VANGL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VANGL2 BINDING SITE, designated SEQ ID:10530, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16947] Another function of GAM96 is therefore inhibition of Vang-like 2 (van gogh, drosophila) (VANGL2, Accession XP_049695.4), a gene which may take part in defining the

lateral boundary of floorplate differentiation and therefore may be associated with Neural tube defects. Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of Neural tube defects, and of other diseases and clinical conditions associated with VANGL2.

[16948] The function of VANGL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Vav 3 oncogene (VAV3, Accession NP_006104.3) is another GAM96 target gene, herein designated TARGET GENE. VAV3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VAV3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VAV3 BINDING SITE, designated SEQ ID:17719, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16949] Another function of GAM96 is therefore inhibition of Vav 3 oncogene (VAV3, Accession NP_006104.3) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAV3.

[16950] Williams beuren syndrome chromosome region 21 (WBSCR21, Accession NP_683713.1) is another GAM96 target gene, herein designated TARGET GENE. WBSCR21 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by WBSCR21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WBSCR21 BINDING SITE, designated SEQ ID:19321, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16951] Another function of GAM96 is therefore inhibition of Williams beuren syndrome chromosome region 21 (WBSCR21, Accession NP_683713.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR21.

[16952] Williams beuren syndrome chromosome region 21 (WBSCR21, Accession NP_112585.2) is another GAM96 target gene, herein designated TARGET GENE. WBSCR21 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by WBSCR21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WBSCR21 BINDING SITE, designated SEQ ID:19321, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16953] Another function of GAM96 is therefore inhibition of Williams beuren syndrome chromosome region 21 (WBSCR21, Accession NP_112585.2) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR21.

[16954] ZFP276 (Accession NP_689500.1) is another GAM96 target gene, herein designated TARGET GENE. ZFP276 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ZFP276, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFP276 BINDING SITE, designated SEQ ID:1176, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16955] Another function of GAM96 is therefore inhibition of ZFP276 (Accession NP_689500.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP276.

[16956] ZFYVE26 (Accession XP_031077.1) is another GAM96 target gene, herein designated TARGET GENE. ZFYVE26 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZFYVE26, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFYVE26 BINDING SITE, designated SEQ ID:13984, to the nucleotide sequence of GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16957] Another function of GAM96 is therefore inhibition of ZFYVE26 (Accession XP_031077.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFYVE26.

[16958] Zinc finger protein 297b (ZNF297B, Accession NP_054726.1) is another GAM96 target gene, herein designated TARGET GENE. ZNF297B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF297B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF297B BINDING SITE, designated SEQ ID:12416, to the nucleotide sequence of

GAM96 RNA, herein designated GAM RNA, also designated SEQ ID:394.

[16959] Another function of GAM96 is therefore inhibition of Zinc finger protein 297b (ZNF297B, Accession NP_054726.1) . Accordingly, utilities of GAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF297B.

[16960]

[16961] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 97 (GAM97), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[16962] GAM97 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM97 was detected is described hereinabove with reference to Figs. 8-15.

[16963] GAM97 gene, herein designated GAM GENE, and GAM97 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[16964] GAM97 gene encodes a GAM97 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA

genes, and unlike most ordinary genes, GAM97 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM97 precursor RNA is designated SEQ ID:175, and is provided hereinbelow with reference to the sequence listing part.

[16965] GAM97 precursor RNA folds onto itself, forming GAM97 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16966] GAM97 precursor RNA folds onto itself, forming GAM97 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nu-

cleotide sequence of the second half thereof.

[16967] Nucleotide sequence of GAM97 precursor RNA, designated SEQ-ID: 175, and a schematic representation of a predicted secondary folding of GAM97 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[16968] An enzyme complex designated DICER COMPLEX, `dices` the GAM97 folded precursor RNA into GAM97 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM97 RNA is designated SEQ ID:274, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[16969] GAM97 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM97 target RNA, herein designated GAM TARGET RNA. GAM97 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein

coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16970] GAM97 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM97 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM97 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM97 RNA may have a different number of target binding sites in untranslated regions of a GAM97 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16971] The complementary binding of GAM97 RNA, herein designated GAM RNA, to target binding sites on GAM97 target

RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM97 target RNA into GAM97 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[16972] It is appreciated that GAM97 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM97 target genes. The mRNA of each one of this plurality of GAM97 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM97 RNA, herein designated GAM RNA, and which when bound by GAM97 RNA causes inhibition of translation of respective one or more GAM97 target proteins.

[16973] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM97 gene, herein designated GAM GENE, on one or more GAM97 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the

known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16974] It is appreciated that specific functions and accordingly utilities of GAM97 correlate with, and may be deduced from, the identity of the target genes which GAM97 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16975]

[16976]

[16977] Ac-like transposable element (ALTE, Accession NM_004729.1) is a GAM97 target gene, herein designated TARGET GENE. ALTE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALTE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALTE BINDING SITE, designated SEQ

ID:13580, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[16978] A function of GAM97 is therefore inhibition of Ac-like transposable element (ALTE, Accession NM_004729.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALTE.

[16979] Chromosome 21 open reading frame 5 (C21orf5, Accession NM_005128.1) is another GAM97 target gene, herein designated TARGET GENE. C21orf5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C21orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf5 BINDING SITE, designated SEQ ID:16569, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[16980] Another function of GAM97 is therefore inhibition of Chromosome 21 open reading frame 5 (C21orf5, Accession NM_005128.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf5.

[16981] Chemokine (c-c motif) receptor 6 (CCR6, Accession NM_031409.1) is another GAM97 target gene, herein designated TARGET GENE. CCR6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCR6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCR6 BINDING SITE, designated SEQ ID:12282, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[16982] Another function of GAM97 is therefore inhibition of Chemokine (c-c motif) receptor 6 (CCR6, Accession NM_031409.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR6.

[16983] DKFZP434N161 (Accession) is another GAM97 target gene, herein designated TARGET GENE. DKFZP434N161 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434N161, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of DKFZP434N161 BINDING SITE, designated SEQ ID:10163, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[16984] Another function of GAM97 is therefore inhibition of DKFZP434N161 (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N161.

[16985] Coagulation factor ii (thrombin) receptor (F2R, Accession NM_001992.2) is another GAM97 target gene, herein designated TARGET GENE. F2R BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by F2R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F2R BINDING SITE, designated SEQ ID:8374, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[16986] Another function of GAM97 is therefore inhibition of Coagulation factor ii (thrombin) receptor (F2R, Accession NM_001992.2), a gene which Thrombin receptor; G protein- coupled receptor involved in platelet activation. Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with F2R.

[16987] The function of F2R has been established by previous studies. Coughlin et al. (1992) reviewed the cloning and characterization of a platelet thrombin (OMIM Ref. No. 176930) receptor (Vu et al., 1991). The thrombin receptor is structurally related to other members of the 7- transmembrane receptor family and has been isolated from diverse cell types. It is intimately involved in the regulation of the thrombotic response. Using PCR analyses of a human/rodent hybrid cell mapping panel, Bahou et al. (1993) assigned the TR gene to chromosome 5. By fluorescence in situ hybridization, they refined the localization to 5q13, confirming its presence as a single locus in the human genome. Poirier et al. (1996) mapped the Cf2r gene to mouse chromosome 13 by studies of an interspecific backcross. Utilizing 2 distinct radiation hybrid mapping panels with different levels of resolution, Schmidt et al. (1997) demonstrated that this gene, sometimes referred to as PAR1, and the proteinase activated receptor-2 gene (OMIM Ref. No. 600933) are tightly linked. Physical mapping using yeast artificial chromosomes and inversion field gel electrophoresis demonstrated that they are maximally separated by 90 kb. Riewald et al. (2002) demon-

strated that activated protein C (OMIM Ref. No. 176860) uses the endothelial cell protein C receptor (EPCR; 600646) as a coreceptor for cleavage of protease- activated receptor 1 (PAR1) on endothelial cells. Gene profiling demonstrated that PAR1 signaling could account for all activated protein C- induced protective genes, including the immunomodulatory monocyte chemoattractant protein- 1 (MCP1; 158105), which was selectively induced by activation of PAR1, but not PAR2 (OMIM Ref. No. 600933). Thus, Riewald et al. (2002) concluded that the prototypical thrombin receptor is the target for EPCR- dependent APC signaling, suggesting a role for this receptor cascade in protection from sepsis.

[16988] Animal model experiments lend further support to the function of F2R. Griffin et al. (2001) reported a role for Par1, a protease- activated G protein- coupled receptor for thrombin, in embryonic development. Approximately one- half of Par1 - /- embryos died at midgestation with bleeding from multiple sites. Par1 is expressed in endothelial cells, and a Par1 transgene driven by an endothelial- specific promoter prevented death of Par1 - /- embryos. Griffin et al. (2001) concluded that the coagulation cascade and PAR1 modulate endothelial cell function

in developing blood vessels and that thrombin's actions on endothelial cells, rather than on platelets, mesenchymal cells, or fibrinogen (see OMIM Ref. No. 134820), contribute to vascular development and hemostasis in the mouse embryo.

[16989] It is appreciated that the abovementioned animal model for F2R is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[16990] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16991] Coughlin, S. R.; Vu, T.- K. H.; Hung, D. T.; Wheaton, V. I. : Characterization of a functional thrombin receptor: issues and opportunities. J. Clin. Invest. 89: 351- 355, 1992. ; and

[16992] Riewald, M.; Petrovan, R. J.; Donner, A.; Mueller, B. M.; Ruf, W. : Activation of endothelial cell protease activated receptor 1 by the protein C pathway. Science 296: 1880-1882, 2002.

[16993] Further studies establishing the function and utilities of F2R are found in John Hopkins OMIM database record ID 187930, and in cited publications listed in Table 5, which

are hereby incorporated by reference.FLJ10547 (Accession NM_018134.1) is another GAM97 target gene, herein designated TARGET GENE. FLJ10547 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10547, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10547 BINDING SITE, designated SEQ ID:9138, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[16994] Another function of GAM97 is therefore inhibition of FLJ10547 (Accession NM_018134.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10547.

[16995] FLJ11996 (Accession NM_024976.1) is another GAM97 target gene, herein designated TARGET GENE. FLJ11996 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11996, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11996 BINDING SITE, designated SEQ ID:4576, to the

nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[16996] Another function of GAM97 is therefore inhibition of FLJ11996 (Accession NM_024976.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11996.

[16997] FLJ12294 (Accession NM_025100.1) is another GAM97 target gene, herein designated TARGET GENE. FLJ12294 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12294, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12294 BINDING SITE, designated SEQ ID:11796, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[16998] Another function of GAM97 is therefore inhibition of FLJ12294 (Accession NM_025100.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12294.

[16999] FLJ13659 (Accession) is another GAM97 target gene, herein designated TARGET GENE. FLJ13659 BINDING SITE is a target binding site found in the 3` untranslated re-

gion of mRNA encoded by FLJ13659, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13659 BINDING SITE, designated SEQ ID:10768, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17000] Another function of GAM97 is therefore inhibition of FLJ13659 (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13659.

[17001] FLJ13848 (Accession NM_024771.1) is another GAM97 target gene, herein designated TARGET GENE. FLJ13848 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13848, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13848 BINDING SITE, designated SEQ ID:14972, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17002] Another function of GAM97 is therefore inhibition of FLJ13848 (Accession NM_024771.1) . Accordingly, utilities

of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13848.

[17003] FLJ14129 (Accession NM_030895.1) is another GAM97 target gene, herein designated TARGET GENE. FLJ14129 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14129, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14129 BINDING SITE, designated SEQ ID:13220, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17004] Another function of GAM97 is therefore inhibition of FLJ14129 (Accession NM_030895.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14129.

[17005] FLJ14326 (Accession) is another GAM97 target gene, herein designated TARGET GENE. FLJ14326 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14326, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14326

BINDING SITE, designated SEQ ID:6959, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17006] Another function of GAM97 is therefore inhibition of FLJ14326 (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14326.

[17007] FLJ20004 (Accession) is another GAM97 target gene, herein designated TARGET GENE. FLJ20004 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20004, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20004 BINDING SITE, designated SEQ ID:4766, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17008] Another function of GAM97 is therefore inhibition of FLJ20004 (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20004.

[17009] FLJ20045 (Accession NM_017638.1) is another GAM97 target gene, herein designated TARGET GENE. FLJ20045

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20045 BINDING SITE, designated SEQ ID:665, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17010] Another function of GAM97 is therefore inhibition of FLJ20045 (Accession NM_017638.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20045.

[17011] FLJ22167 (Accession NM_024533.2) is another GAM97 target gene, herein designated TARGET GENE. FLJ22167 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22167, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22167 BINDING SITE, designated SEQ ID:11162, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17012] Another function of GAM97 is therefore inhibition of

FLJ22167 (Accession NM_024533.2) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22167.

[17013] FLJ23499 (Accession NM_022761.1) is another GAM97 target gene, herein designated TARGET GENE. FLJ23499 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23499, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23499 BINDING SITE, designated SEQ ID:7763, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17014] Another function of GAM97 is therefore inhibition of FLJ23499 (Accession NM_022761.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23499.

[17015] FLJ31455 (Accession NM_144964.1) is another GAM97 target gene, herein designated TARGET GENE. FLJ31455 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31455, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ31455 BINDING SITE, designated SEQ ID:12283, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17016] Another function of GAM97 is therefore inhibition of FLJ31455 (Accession NM_144964.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31455.

[17017] FRSB (Accession NM_005687.2) is another GAM97 target gene, herein designated TARGET GENE. FRSB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FRSB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FRSB BINDING SITE, designated SEQ ID:17514, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17018] Another function of GAM97 is therefore inhibition of FRSB (Accession NM_005687.2) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRSB.

[17019] Fus interacting protein (serine-arginine rich) 1 (FUSIP1,

Accession NM_006625.3) is another GAM97 target gene, herein designated TARGET GENE. FUSIP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FUSIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FUSIP1 BINDING SITE, designated SEQ ID:10769, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17020] Another function of GAM97 is therefore inhibition of Fus interacting protein (serine-arginine rich) 1 (FUSIP1, Accession NM_006625.3) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUSIP1.

[17021] Fucosyltransferase 6 (alpha (1,3) fucosyltransferase) (FUT6, Accession NM_000150.1) is another GAM97 target gene, herein designated TARGET GENE. FUT6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FUT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FUT6 BINDING

SITE, designated SEQ ID:6754, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17022] Another function of GAM97 is therefore inhibition of Fucosyltransferase 6 (alpha (1,3) fucosyltransferase) (FUT6, Accession NM_000150.1), a gene which is involved in the biosynthesis of the e- selectin ligand, sialyl- lewis x. catalyzes the transfer of fucose from gdp- beta- fucose to alpha- 2,3 sialylated substrates. Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT6.

[17023] The function of FUT6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Huntingtin interacting protein 1 (HIP1, Accession NM_005338.3) is another GAM97 target gene, herein designated TARGET GENE. HIP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIP1 BINDING SITE, designated SEQ ID:3689, to the nucleotide sequence of GAM97 RNA,

herein designated GAM RNA, also designated SEQ ID:274.

[17024] Another function of GAM97 is therefore inhibition of Huntingtin interacting protein 1 (HIP1, Accession NM_005338.3), a gene which is a membrane protein and interacts with huntingtin. and therefore may be associated with Huntington disease. Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of Huntington disease, and of other diseases and clinical conditions associated with HIP1.

[17025] The function of HIP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Interleukin 18 (interferon-gamma-inducing factor) (IL18, Accession NM_001562.2) is another GAM97 target gene, herein designated TARGET GENE. IL18 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL18 BINDING SITE, designated SEQ ID:13191, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17026] Another function of GAM97 is therefore inhibition of Interleukin 18 (interferon-gamma-inducing factor) (IL18, Accession NM_001562.2), a gene which augments natural killer cell activity in spleen cells and stimulates interferon gamma production in t helper type i cells. and therefore may be associated with Crohn disease. Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of Crohn disease, and of other diseases and clinical conditions associated with IL18.

[17027] The function of IL18 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.KIAA0441 (Accession NM_014797.1) is another GAM97 target gene, herein designated TARGET GENE. KIAA0441 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0441, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0441 BINDING SITE, designated SEQ ID:11797, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17028] Another function of GAM97 is therefore inhibition of

KIAA0441 (Accession NM_014797.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0441.

[17029] KIAA0798 (Accession) is another GAM97 target gene, herein designated TARGET GENE. KIAA0798 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0798, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0798 BINDING SITE, designated SEQ ID:13756, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17030] Another function of GAM97 is therefore inhibition of KIAA0798 (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0798.

[17031] KIAA0872 (Accession NM_014940.1) is another GAM97 target gene, herein designated TARGET GENE. KIAA0872 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0872, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0872 BINDING SITE, designated SEQ ID:13072, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17032] Another function of GAM97 is therefore inhibition of KIAA0872 (Accession NM_014940.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0872.

[17033] KIAA1456 (Accession XM_040100.4) is another GAM97 target gene, herein designated TARGET GENE. KIAA1456 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1456, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1456 BINDING SITE, designated SEQ ID:14943, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17034] Another function of GAM97 is therefore inhibition of KIAA1456 (Accession XM_040100.4) . Accordingly, utilities of GAM97 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1456.

[17035] KIAA1614 (Accession XM_046531.1) is another GAM97 target gene, herein designated TARGET GENE. KIAA1614 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1614, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1614 BINDING SITE, designated SEQ ID:628, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17036] Another function of GAM97 is therefore inhibition of KIAA1614 (Accession XM_046531.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1614.

[17037] KREMEN (Accession) is another GAM97 target gene, herein designated TARGET GENE. KREMEN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KREMEN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of KREMEN BINDING SITE, designated SEQ ID:2640, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17038] Another function of GAM97 is therefore inhibition of KREMEN (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KREMEN.

[17039] LOC127262 (Accession XM_072073.6) is another GAM97 target gene, herein designated TARGET GENE. LOC127262 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC127262, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC127262 BINDING SITE, designated SEQ ID:17509, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17040] Another function of GAM97 is therefore inhibition of LOC127262 (Accession XM_072073.6) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127262.

[17041] LOC145216 (Accession XM_096730.1) is another GAM97 target gene, herein designated TARGET GENE. LOC145216 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145216, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145216 BINDING SITE, designated SEQ ID:7110, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17042] Another function of GAM97 is therefore inhibition of LOC145216 (Accession XM_096730.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145216.

[17043] LOC145231 (Accession XM_096740.1) is another GAM97 target gene, herein designated TARGET GENE. LOC145231 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145231, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145231 BINDING SITE, designated SEQ ID:17584, to

the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17044] Another function of GAM97 is therefore inhibition of LOC145231 (Accession XM_096740.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145231.

[17045] LOC146756 (Accession XM_097085.5) is another GAM97 target gene, herein designated TARGET GENE. LOC146756 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146756, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146756 BINDING SITE, designated SEQ ID:6711, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17046] Another function of GAM97 is therefore inhibition of LOC146756 (Accession XM_097085.5) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146756.

[17047] LOC148946 (Accession) is another GAM97 target gene,

herein designated TARGET GENE. LOC148946 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148946, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148946 BINDING SITE, designated SEQ ID:13319, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17048] Another function of GAM97 is therefore inhibition of LOC148946 (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148946.

[17049] LOC150185 (Accession) is another GAM97 target gene, herein designated TARGET GENE. LOC150185 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150185, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150185 BINDING SITE, designated SEQ ID:13995, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17050] Another function of GAM97 is therefore inhibition of LOC150185 (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150185.

[17051] LOC197201 (Accession XM_113839.4) is another GAM97 target gene, herein designated TARGET GENE. LOC197201 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197201, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197201 BINDING SITE, designated SEQ ID:9296, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17052] Another function of GAM97 is therefore inhibition of LOC197201 (Accession XM_113839.4) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197201.

[17053] LOC200251 (Accession) is another GAM97 target gene, herein designated TARGET GENE. LOC200251 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC200251, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200251 BINDING SITE, designated SEQ ID:18779, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17054] Another function of GAM97 is therefore inhibition of LOC200251 (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200251.

[17055] LOC219722 (Accession XM_167593.1) is another GAM97 target gene, herein designated TARGET GENE. LOC219722 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC219722, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219722 BINDING SITE, designated SEQ ID:19631, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17056] Another function of GAM97 is therefore inhibition of LOC219722 (Accession XM_167593.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC219722.

[17057] LOC221641 (Accession) is another GAM97 target gene, herein designated TARGET GENE. LOC221641 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221641, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221641 BINDING SITE, designated SEQ ID:4944, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17058] Another function of GAM97 is therefore inhibition of LOC221641 (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221641.

[17059] LOC221954 (Accession XM_168349.1) is another GAM97 target gene, herein designated TARGET GENE. LOC221954 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221954, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC221954 BINDING SITE, designated SEQ ID:15826, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17060] Another function of GAM97 is therefore inhibition of LOC221954 (Accession XM_168349.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221954.

[17061] LOC254531 (Accession NM_153613.1) is another GAM97 target gene, herein designated TARGET GENE. LOC254531 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC254531, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254531 BINDING SITE, designated SEQ ID:12649, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17062] Another function of GAM97 is therefore inhibition of LOC254531 (Accession NM_153613.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254531.

[17063] LOC255196 (Accession) is another GAM97 target gene, herein designated TARGET GENE. LOC255196 BINDING SITE1 and LOC255196 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC255196, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255196 BINDING SITE1 and LOC255196 BINDING SITE2, designated SEQ ID:10392 and SEQ ID:19720 respectively, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17064] Another function of GAM97 is therefore inhibition of LOC255196 (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255196.

[17065] LOC255937 (Accession) is another GAM97 target gene, herein designated TARGET GENE. LOC255937 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255937, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC255937 BINDING SITE, designated SEQ ID:4791, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17066] Another function of GAM97 is therefore inhibition of LOC255937 (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255937.

[17067] LOC257576 (Accession) is another GAM97 target gene, herein designated TARGET GENE. LOC257576 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC257576, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257576 BINDING SITE, designated SEQ ID:10645, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17068] Another function of GAM97 is therefore inhibition of LOC257576 (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257576.

[17069] LOC57118 (Accession) is another GAM97 target gene, herein designated TARGET GENE. LOC57118 BINDING SITE

is a target binding site found in the 5` untranslated region of mRNA encoded by LOC57118, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC57118 BINDING SITE, designated SEQ ID:11157, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17070] Another function of GAM97 is therefore inhibition of LOC57118 (Accession) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57118.

[17071] Mannan-binding lectin serine protease 1 (c4/c2 activating component of ra-reactive factor) (MASP1, Accession NM_001879.3) is another GAM97 target gene, herein designated TARGET GENE. MASP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MASP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MASP1 BINDING SITE, designated SEQ ID:692, to the nucleotide sequence of GAM97 RNA, herein designated GAM

RNA, also designated SEQ ID:274.

[17072] Another function of GAM97 is therefore inhibition of Mannan-binding lectin serine protease 1 (c4/c2 activating component of ra-reactive factor) (MASP1, Accession NM_001879.3), a gene which a complement- dependent bactericidal factor . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MASP1.

[17073] The function of MASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.MGC10765 (Accession NM_024345.1) is another GAM97 target gene, herein designated TARGET GENE. MGC10765 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10765, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10765 BINDING SITE, designated SEQ ID:10417, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17074] Another function of GAM97 is therefore inhibition of

MGC10765 (Accession NM_024345.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10765.

[17075] MGC14799 (Accession NM_032336.1) is another GAM97 target gene, herein designated TARGET GENE. MGC14799 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC14799, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC14799 BINDING SITE, designated SEQ ID:15396, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17076] Another function of GAM97 is therefore inhibition of MGC14799 (Accession NM_032336.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14799.

[17077] Solute carrier family 14 (urea transporter), member 2 (SLC14A2, Accession NM_007163.2) is another GAM97 target gene, herein designated TARGET GENE. SLC14A2 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by SLC14A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC14A2 BINDING SITE, designated SEQ ID:5703, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17078] Another function of GAM97 is therefore inhibition of Solute carrier family 14 (urea transporter), member 2 (SLC14A2, Accession NM_007163.2), a gene which is a renal urea transporter 2. and therefore may be associated with Orthostatic hypotension. Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of Orthostatic hypotension, and of other diseases and clinical conditions associated with SLC14A2.

[17079] The function of SLC14A2 has been established by previous studies. Genetic variation in proteins that determine sodium reabsorption and excretion significantly influences blood pressure. Ranade et al. (2001) investigated whether nucleotide variation in human UT2 could be associated with variation in blood pressure. Seven single- nucleotide polymorphisms (SNPs) were identified, including val227 to ile and ala357 to thr. Over 1,000 hypertensive and low-

normotensive individuals of Chinese origin were genotyped. The ile227 and ala357 alleles were associated with low diastolic blood pressure in men but not women, with odds ratios 2.1 (95% confidence interval 1.5- 2.7, P less than 0.001) and 1.5 (95% confidence interval 1.2- 1.8, P less than 0.001), respectively. There was a similar trend for systolic blood pressure, and odds ratios for the ile227 and ala357 alleles were 1.7 (95% confidence interval 1.2- 2.3, P = 0.002) and 1.3 (95% confidence interval 1.1- 1.6, P = 0.007), respectively, in men. DeStefano et al. (1998) identified a locus for orthostatic hypotension (OHDS; 143850) on chromosome 18q, with a peak lod score of 3.92 at D18S1367 in 2 linked families. The proximity of human UT2 makes it a potential candidate gene for this autosomal dominant disorder.

[17080]

[17081] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17082] Ranade, K.; Wu, K.- W.; Hwu, C.- M.; Ting, C.- T.; Pei, D.; Pesich, R.; Hebert, J.; Chen, Y.- D. I.; Pratt, R.; Olshen, R.; Masaki, K.; Risch, N.; Cox, D. R.; Botstein, D. : Genetic variation in the human urea transporter- 2 is associated

with variation in blood pressure. Hum. Molec. Genet. 10: 2157- 2164, 2001. ; and

[17083] DeStefano, A. L.; Baldwin, C. T.; Burzstyn, M.; Gavras, I.; Handy, D. E.; Joost, O.; Martel, T.; Nicolaou, M.; Schwartz, F.; Streeten, D. H. P.; Farrer, L. A.; Gavras, H. : Autosomal domin.

[17084] Further studies establishing the function and utilities of SLC14A2 are found in John Hopkins OMIM database record ID 601611, and in cited publications listed in Table 5, which are hereby incorporated by reference.T-cell leukemia translocation altered gene (TCTA, Accession NM_022171.1) is another GAM97 target gene, herein designated TARGET GENE. TCTA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TCTA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCTA BINDING SITE, designated SEQ ID:681, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17085] Another function of GAM97 is therefore inhibition of T-cell leukemia translocation altered gene (TCTA, Accession NM_022171.1) . Accordingly, utilities of GAM97 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with TCTA.

[17086] Zinc finger protein 33a (kox 31) (ZNF33A, Accession NM_006974.1) is another GAM97 target gene, herein designated TARGET GENE. ZNF33A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF33A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF33A BINDING SITE, designated SEQ ID:11954, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17087] Another function of GAM97 is therefore inhibition of Zinc finger protein 33a (kox 31) (ZNF33A, Accession NM_006974.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF33A.

[17088] Zinc finger protein 347 (ZNF347, Accession NM_032584.1) is another GAM97 target gene, herein designated TARGET GENE. ZNF347 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF347, corresponding to a target binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF347 BINDING SITE, designated SEQ ID:4168, to the nucleotide sequence of GAM97 RNA, herein designated GAM RNA, also designated SEQ ID:274.

[17089] Another function of GAM97 is therefore inhibition of Zinc finger protein 347 (ZNF347, Accession NM_032584.1) . Accordingly, utilities of GAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF347.

[17090]

[17091] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 98 (GAM98), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17092] GAM98 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM98 was detected is described hereinabove with reference to Figs. 8-15.

[17093] GAM98 gene, herein designated GAM GENE, and GAM98

target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[17094] GAM98 gene encodes a GAM98 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM98 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM98 precursor RNA is designated SEQ ID:61, and is provided hereinbelow with reference to the sequence listing part.

[17095] GAM98 precursor RNA folds onto itself, forming GAM98 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17096] GAM98 precursor RNA folds onto itself, forming GAM98 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[17097] Nucleotide sequence of GAM98 precursor RNA, designated SEQ-ID: 61, and a schematic representation of a predicted secondary folding of GAM98 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[17098] An enzyme complex designated DICER COMPLEX, `dices` the GAM98 folded precursor RNA into GAM98 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM98 RNA is designated SEQ ID:344, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[17099] GAM98 target gene, herein designated TARGET GENE, en-

codes a corresponding messenger RNA, GAM98 target RNA, herein designated GAM TARGET RNA. GAM98 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17100] GAM98 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM98 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM98 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM98 RNA may have a different number of target binding sites in untranslated regions of a GAM98 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17101] The complementary binding of GAM98 RNA, herein designated GAM RNA, to target binding sites on GAM98 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM98 target RNA into GAM98 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17102] It is appreciated that GAM98 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM98 target genes. The mRNA of each one of this plurality of GAM98 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM98 RNA, herein designated GAM RNA, and which when bound by GAM98 RNA causes inhibition of translation of respective one or more GAM98 target proteins.

[17103] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM98 gene, herein designated GAM GENE, on one or more GAM98 target genes, herein collectively designated

TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17104] It is appreciated that specific functions and accordingly utilities of GAM98 correlate with, and may be deduced from, the identity of the target genes which GAM98 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17105]

[17106]

[17107] Growth arrest-specific 7 (GAS7, Accession NM_005890.1) is a GAM98 target gene, herein designated TARGET GENE. GAS7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA en-

coded by GAS7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAS7 BINDING SITE, designated SEQ ID:8289, to the nucleotide sequence of GAM98 RNA, herein designated GAM RNA, also designated SEQ ID:344.

[17108] A function of GAM98 is therefore inhibition of Growth arrest-specific 7 (GAS7, Accession NM_005890.1), a gene which may play a role in promoting maturation and morphological differentiation of cerebellar neurons. and therefore may be associated with Leukemias with myeloid/lymphoid (mll). Accordingly, utilities of GAM98 include diagnosis, prevention and treatment of Leukemias with myeloid/lymphoid (mll), and of other diseases and clinical conditions associated with GAS7.

[17109] The function of GAS7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.LOC254685 (Accession) is another GAM98 target gene, herein designated TARGET GENE. LOC254685 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC254685, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254685 BINDING SITE, designated SEQ ID:19570, to the nucleotide sequence of GAM98 RNA, herein designated GAM RNA, also designated SEQ ID:344.

[17110] Another function of GAM98 is therefore inhibition of LOC254685 (Accession) . Accordingly, utilities of GAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254685.

[17111] LOC96597 (Accession XM_039922.2) is another GAM98 target gene, herein designated TARGET GENE. LOC96597 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC96597, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC96597 BINDING SITE, designated SEQ ID:7069, to the nucleotide sequence of GAM98 RNA, herein designated GAM RNA, also designated SEQ ID:344.

[17112] Another function of GAM98 is therefore inhibition of LOC96597 (Accession XM_039922.2) . Accordingly, utilities of GAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC96597.

[17113] Solute carrier family 7 (cationic amino acid transporter, y+ system), member 5 (SLC7A5, Accession NM_003486.2) is another GAM98 target gene, herein designated TARGET GENE. SLC7A5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC7A5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC7A5 BINDING SITE, designated SEQ ID:6778, to the nucleotide sequence of GAM98 RNA, herein designated GAM RNA, also designated SEQ ID:344.

[17114] Another function of GAM98 is therefore inhibition of Solute carrier family 7 (cationic amino acid transporter, y+ system), member 5 (SLC7A5, Accession NM_003486.2), a gene which mediates transport of large and small neutral amino acids. Accordingly, utilities of GAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A5.

[17115] The function of SLC7A5 has been established by previous studies. Gaugitsch et al. (1992) cloned a partial human E16 cDNA sequence that was expressed in activated lymphocytes. It was cloned by virtue of its AUUUA rapid

degradation signal. Kanai et al. (1998) used expression cloning to isolate a rat cDNA termed LAT1. They showed that LAT1 encoded a protein necessary for system L amino acid transport, thought to be a major route by which cells import large neutral amino acids with branched or aromatic side chains. Mastroberardino et al. (1998) identified the human E16 protein (AF077866) as the first light chain of 4F2 (OMIM Ref. No. 158070), a cell surface glycoprotein, and showed that the resulting heterodimeric complex mediates L- type amino acid transport. Maglott et al. (1994) mapped a gene fragment, EST00889 (OMIM Ref. No. M78741), to chromosome 16 (D16S469E). The map position was refined to 16q24.3 by use of a panel of mouse/human somatic cell hybrids. Maglott et al. (1994) showed that the gene is expressed abundantly in adult lung and liver, and is also expressed in human brain, thymus, retina, and some other tissues.

[17116]

[17117] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17118] Mastroberardino, L.; Spindler, B.; Pfeiffer, R.; Skelly, P. J.; Loffing, J.; Shoemaker, C. B.; Verrey, F. : Amino- acid

transport by heterodimers of 4F2hc/CD98 and members of a permease family. Nature 395: 288- 291, 1998. ; and

[17119] Maglott, D. R.; Durkin, A. S.; Lane, S. A.; Callen, D. F.; Feldblyum, T. V.; Nierman, W. C. : The gene for membrane protein E16 (D16S469E) maps to human chromosome 16q24.3 and is expressed.

[17120] Further studies establishing the function and utilities of SLC7A5 are found in John Hopkins OMIM database record ID 600182, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[17121] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 99 (GAM99), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17122] GAM99 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM99 was detected is described hereinabove with reference to Figs. 8-15.

[17123] GAM99 gene, herein designated GAM GENE, and GAM99 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[17124] GAM99 gene encodes a GAM99 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM99 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM99 precursor RNA is designated SEQ ID:135, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:135 is located at position 15 relative to chromosome 10.

[17125] GAM99 precursor RNA folds onto itself, forming GAM99 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17126] GAM99 precursor RNA folds onto itself, forming GAM99 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[17127] Nucleotide sequence of GAM99 precursor RNA, designated SEQ-ID: 135, and a schematic representation of a predicted secondary folding of GAM99 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[17128] An enzyme complex designated DICER COMPLEX, `dices` the GAM99 folded precursor RNA into GAM99 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: A) nucleotide sequence of GAM99 RNA is designated SEQ ID:320, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[17129] GAM99 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM99 target

RNA, herein designated GAM TARGET RNA. GAM99 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17130] GAM99 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM99 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM99 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM99 RNA may have a different number of target binding sites in untranslated regions of a GAM99 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[17131] The complementary binding of GAM99 RNA, herein designated GAM RNA, to target binding sites on GAM99 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM99 target RNA into GAM99 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17132] It is appreciated that GAM99 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM99 target genes. The mRNA of each one of this plurality of GAM99 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM99 RNA, herein designated GAM RNA, and which when bound by GAM99 RNA causes inhibition of translation of respective one or more GAM99 target proteins.

[17133] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM99 gene, herein designated GAM GENE, on one or more GAM99 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes.

As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17134] It is appreciated that specific functions and accordingly utilities of GAM99 correlate with, and may be deduced from, the identity of the target genes which GAM99 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17135]

[17136]

[17137] Actin, alpha, cardiac muscle (ACTC, Accession NP_005150.1) is a GAM99 target gene, herein designated TARGET GENE. ACTC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACTC, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACTC BINDING SITE, designated SEQ ID:17458, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17138] A function of GAM99 is therefore inhibition of Actin, alpha, cardiac muscle (ACTC, Accession NP_005150.1), a gene which Actin of cells including muscle and therefore may be associated with Idiopathic dilated cardiomyopathy (idc), and of familial hypertrophic cardiomyopathy (fhc). Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Idiopathic dilated cardiomyopathy (idc), and of familial hypertrophic cardiomyopathy (fhc), and of other diseases and clinical conditions associated with ACTC.

[17139] The function of ACTC has been established by previous studies. Actin has been identified in many kinds of cells including muscle, where it is a major constituent of the thin filament, and platelets. Muscle actins from sources as diverse as rabbits and fish are very similar in amino acid sequence. Elzinga et al. (1976) examined whether actin in different tissues of the same organism are products of the same gene. They found that human platelet and human

cardiac actins differ by one amino acid, viz., threonine and valine, respectively, at position 129. Thus they must be determined by different genes. Actins can be separated by isoelectric focusing into 3 main groups which show more than 90% homology of amino acid sequence. Firtel (1981) referred to the actin of smooth muscle, the most acidic form, as alpha type and the 2 cytoplasmic forms as beta and gamma. Beta and gamma actins are involved in the cytoskeleton and in internal cell mobility phenomena. The actins constitute multiple gene families. There is only a 4% amino acid difference in the actins of Physarum and mammals. In mammals, 4 different muscle actins have been sequenced: from fast muscle, heart, aorta, and stomach. These vary only by 4 to 6 amino acids from each other, and by about 25 amino acids from the beta and gamma actins. Thus, from the protein data, at least 6 actin genes would be expected in mammals. Recombinant DNA probes for both actin and myosin of the mouse have been made (Weydert et al., 1981). Because actin is a highly conserved protein, Engel et al. (1981) could use cloned actin genes from Drosophila and from chicken to isolate 12 actin gene fragments from a human DNA library. Restriction endonuclease studies of each indicated that they are

not allelic and are from nonoverlapping regions of the genome. In all, 25 to 30 EcoRI fragments homologous to actin genes were found in the human genome and no restriction site polymorphism was found indicating evolutionary conservatism. Humphries et al. (1981) used probes from the mouse to detect actin genes in human DNA and concluded that there are about 20 actin genes in the human genome. Three lines of evidence supported this number: the rate of hybridization of the mouse probe with human DNA; the fact that the probe hybridizes to 17- 20 bands in Southern blots of restriction enzyme digests of total human DNA; restriction enzyme mapping of individual human actin genes indicating at least 9 different genes, judged on probability grounds to have been picked from a pool of at least 20. Litt and Luty (1989) used PCR to amplify a microsatellite hypervariable repeat in the human cardiac actin gene. They detected 12 different allelic fragments in 37 unrelated individuals, of whom 32 were heterozygous. (Weber and May (1989) also found that (GT)n repeats within human loci are highly polymorphic.) In vertebrates, 6 actin isoforms are known: 4 muscle types (skeletal, cardiac, and 2 smooth muscle types) and 2 nonmuscle types (cytoplasmic actins). In a 36- year- old

mother and 2 daughters, aged 5 and 2 years, of German ancestry who had CMD (see OMIM Ref. No. 115200), Olson et al. (1998) found a G- to- A substitution in codon 312 in exon 5 of the ACTC gene, resulting in an arg312- to- his (R312H) amino acid substitution. A 15- year- old son likewise had inherited the mutation but had not developed CMD.

[17140]

[17141] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17142] Weber, J. L.; May, P. E. : Abundant class of human DNA polymorphisms which can be typed using the polymerase chain reaction. Am. J. Hum. Genet. 44: 388- 396, 1989. ; and

[17143] Olson, T. M.; Michels, V. V.; Thibodeau, S. N.; Tai, Y.- S.; Keating, M. T. : Actin mutations in dilated cardiomyopathy, a heritable form of heart failure. Science 280: 750- 752, 1998.

[17144] Further studies establishing the function and utilities of ACTC are found in John Hopkins OMIM database record ID 102540, and in cited publications listed in Table 5, which are hereby incorporated by reference.AD-020 (Accession

NP_064526.1) is another GAM99 target gene, herein designated TARGET GENE. AD-020 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AD-020, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AD-020 BINDING SITE, designated SEQ ID:9059, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17145] Another function of GAM99 is therefore inhibition of AD-020 (Accession NP_064526.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AD-020.

[17146] A kinase (prka) anchor protein 2 (AKAP2, Accession NP_009134.1) is another GAM99 target gene, herein designated TARGET GENE. AKAP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AKAP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AKAP2 BINDING SITE, designated SEQ ID:17496, to the

nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17147] Another function of GAM99 is therefore inhibition of A kinase (prka) anchor protein 2 (AKAP2, Accession NP_009134.1), a gene which binds to regulatory subunit (rii) of protein kinase a. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP2.

[17148] The function of AKAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Aspartoacylase (aminoacylase 2, canavan disease) (ASPA, Accession NP_000040.1) is another GAM99 target gene, herein designated TARGET GENE. ASPA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ASPA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASPA BINDING SITE, designated SEQ ID:13895, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17149] Another function of GAM99 is therefore inhibition of As-

partoacylase (aminoacylase 2, canavan disease) (ASPA, Accession NP_000040.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPA.

[17150] B7 (Accession NP_008923.1) is another GAM99 target gene, herein designated TARGET GENE. B7 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by B7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of B7 BINDING SITE, designated SEQ ID:11263, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17151] Another function of GAM99 is therefore inhibition of B7 (Accession NP_008923.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B7.

[17152] BASE (Accession NP_776258.1) is another GAM99 target gene, herein designated TARGET GENE. BASE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BASE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BASE BINDING SITE, designated SEQ ID:13840, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17153] Another function of GAM99 is therefore inhibition of BASE (Accession NP_776258.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BASE.

[17154] Basic leucine zipper and w2 domains 2 (BZW2, Accession NP_054757.1) is another GAM99 target gene, herein designated TARGET GENE. BZW2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BZW2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BZW2 BINDING SITE, designated SEQ ID:2127, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17155] Another function of GAM99 is therefore inhibition of Basic leucine zipper and w2 domains 2 (BZW2, Accession NP_054757.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with BZW2.

[17156] C14orf135 (Accession NP_071940.2) is another GAM99 target gene, herein designated TARGET GENE. C14orf135 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C14orf135, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf135 BINDING SITE, designated SEQ ID:8362, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17157] Another function of GAM99 is therefore inhibition of C14orf135 (Accession NP_071940.2) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf135.

[17158] Chromosome 15 open reading frame 5 (C15orf5, Accession NP_112206.1) is another GAM99 target gene, herein designated TARGET GENE. C15orf5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C15orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of C15orf5 BINDING SITE, designated SEQ ID:5753, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17159] Another function of GAM99 is therefore inhibition of Chromosome 15 open reading frame 5 (C15orf5, Accession NP_112206.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C15orf5.

[17160] Chromosome 1 open reading frame 24 (C1orf24, Accession NP_443198.1) is another GAM99 target gene, herein designated TARGET GENE. C1orf24 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C1orf24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:19182, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17161] Another function of GAM99 is therefore inhibition of Chromosome 1 open reading frame 24 (C1orf24, Accession NP_443198.1) . Accordingly, utilities of GAM99 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24.

[17162] Complement component 1, q subcomponent, receptor 1 (C1QR1, Accession NP_036204.1) is another GAM99 target gene, herein designated TARGET GENE. C1QR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1QR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1QR1 BINDING SITE, designated SEQ ID:4397, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17163] Another function of GAM99 is therefore inhibition of Complement component 1, q subcomponent, receptor 1 (C1QR1, Accession NP_036204.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QR1.

[17164] Chromosome 20 open reading frame 103 (C20orf103, Accession NP_036393.1) is another GAM99 target gene, herein designated TARGET GENE. C20orf103 BINDING SITE1 and C20orf103 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by

C20orf103, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf103 BINDING SITE1 and C20orf103 BINDING SITE2, designated SEQ ID:3291 and SEQ ID:1178 respectively, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17165] Another function of GAM99 is therefore inhibition of Chromosome 20 open reading frame 103 (C20orf103, Accession NP_036393.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf103.

[17166] Chromosome 20 open reading frame 45 (C20orf45, Accession NP_057129.1) is another GAM99 target gene, herein designated TARGET GENE. C20orf45 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf45, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf45 BINDING SITE, designated SEQ ID:18788, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA,

also designated SEQ ID:320.

[17167] Another function of GAM99 is therefore inhibition of Chromosome 20 open reading frame 45 (C20orf45, Accession NP_057129.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf45.

[17168] Chromosome 20 open reading frame 55 (C20orf55, Accession NP_113612.1) is another GAM99 target gene, herein designated TARGET GENE. C20orf55 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C20orf55, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf55 BINDING SITE, designated SEQ ID:481, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17169] Another function of GAM99 is therefore inhibition of Chromosome 20 open reading frame 55 (C20orf55, Accession NP_113612.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf55.

[17170] Chromosome 21 open reading frame 67 (C21orf67, Ac-

cession NP_478068.1) is another GAM99 target gene, herein designated TARGET GENE. C21orf67 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C21orf67, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf67 BINDING SITE, designated SEQ ID:531, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17171] Another function of GAM99 is therefore inhibition of Chromosome 21 open reading frame 67 (C21orf67, Accession NP_478068.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf67.

[17172] CAB2 (Accession NP_219487.2) is another GAM99 target gene, herein designated TARGET GENE. CAB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAB2 BINDING SITE, designated SEQ ID:17481, to the nucleotide se-

quence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17173] Another function of GAM99 is therefore inhibition of CAB2 (Accession NP_219487.2) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAB2.

[17174] Cysteine conjugate-beta lyase; cytoplasmic (glutamine transaminase k, kyneurenine aminotransferase) (CCBL1, Accession NP_004050.1) is another GAM99 target gene, herein designated TARGET GENE. CCBL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCBL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCBL1 BINDING SITE, designated SEQ ID:8720, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17175] Another function of GAM99 is therefore inhibition of Cysteine conjugate-beta lyase; cytoplasmic (glutamine transaminase k, kyneurenine aminotransferase) (CCBL1, Accession NP_004050.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with CCBL1.

[17176] Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NP_201588.1) is another GAM99 target gene, herein designated TARGET GENE. CDC14B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDC14B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:12278, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17177] Another function of GAM99 is therefore inhibition of Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NP_201588.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B.

[17178] Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NP_003662.1) is another GAM99 target gene, herein designated TARGET GENE. CDC14B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CDC14B, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:12278, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17179] Another function of GAM99 is therefore inhibition of Cdc14 cell division cycle 14 homolog b (s. cerevisiae) (CDC14B, Accession NP_003662.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B.

[17180] Choline kinase-like (CHKL, Accession NP_689466.1) is another GAM99 target gene, herein designated TARGET GENE. CHKL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CHKL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHKL BINDING SITE, designated SEQ ID:15506, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17181] Another function of GAM99 is therefore inhibition of Choline kinase-like (CHKL, Accession NP_689466.1) . Ac-

cordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHKL.

[17182] Copine vi (neuronal) (CPNE6, Accession NP_006023.1) is another GAM99 target gene, herein designated TARGET GENE. CPNE6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CPNE6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPNE6 BINDING SITE, designated SEQ ID:15300, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17183] Another function of GAM99 is therefore inhibition of Copine vi (neuronal) (CPNE6, Accession NP_006023.1), a gene which may have a role in membrane trafficking. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPNE6.

[17184] The function of CPNE6 has been established by previous studies. Using a 2- dimensional cDNA display system, restriction landmark cDNA scanning, Nakayama et al. (1998) isolated copine VI, which they designated N- copine, from

mouse and human brain cDNA libraries. The human cDNA encodes a 557- amino acid protein. Like copine I, copine VI contains 2 C2 domains in the N terminus that show greater similarity to those of PLC- gamma (see OMIM Ref. No. 172420) rather than those of double C2 domain proteins. Northern blot analysis detected a 2.2- kb transcript in brain only. By in situ hybridization, Nakayama et al. (1998) demonstrated that expression of CPNE6 is upregulated by neuronal activity such as kainate stimulation. The authors suggested that CPNE6 may play a role in synaptic plasticity. In further in situ hybridization studies in mouse, Nakayama et al. (1999) demonstrated that CPNE6 is expressed exclusively in neurons of the hippocampus and in the main and accessory olfactory bulbs, where various forms of synaptic plasticity and memory formation occur. Immunohistochemical studies detected CPNE6 mainly in the cell bodies and dentrites in the neurons, suggesting that CPNE6 has a role in postsynaptic events, in contrast to the presynaptic roles of the double C2 domain proteins. A GST- fusion protein with the second C2 domain of copine VI showed calcium- dependent binding to phosphatidylserine, indicating that this domain is responsible for the calcium- dependent association of copine VI with

the membrane

[17185]

[17186] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17187] Nakayama, T.; Yaoi, T.; Kuwajima, G. : Localization and subcellular distribution of N- copine in mouse brain. J. Neurochem. 72: 373- 379, 1999. ; and

[17188] Nakayama, T.; Yaoi, Y.; Yasui, M.; Kuwajima, G. : N- copine: a novel two C2- domain- containing protein with neuronal activity- regulated expression. FEBS Lett. 428: 80- 84, 1998.

[17189] Further studies establishing the function and utilities of CPNE6 are found in John Hopkins OMIM database record ID 605688, and in cited publications listed in Table 5, which are hereby incorporated by reference.Carnitine palmitoyltransferase 1b (muscle) (CPT1B, Accession NP_689453.1) is another GAM99 target gene, herein designated TARGET GENE. CPT1B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CPT1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates

the complementarity of the nucleotide sequences of CPT1B BINDING SITE, designated SEQ ID:15506, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17190] Another function of GAM99 is therefore inhibition of Carnitine palmitoyltransferase 1b (muscle) (CPT1B, Accession NP_689453.1), a gene which is a rate- controlling enzyme of long- chain fatty acid b- oxidation pathway. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPT1B.

[17191] The function of CPT1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Cathepsin k (pycnodysostosis) (CTSK, Accession NP_000387.1) is another GAM99 target gene, herein designated TARGET GENE. CTSK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTSK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CTSK BINDING SITE, designated SEQ ID:5778, to the nucleotide sequence of GAM99 RNA,

herein designated GAM RNA, also designated SEQ ID:320.

[17192] Another function of GAM99 is therefore inhibition of Cathepsin k (pycnodysostosis) (CTSK, Accession NP_000387.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTSK.

[17193] Chemokine (c-x3-c motif) receptor 1 (CX3CR1, Accession NP_001328.1) is another GAM99 target gene, herein designated TARGET GENE. CX3CR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CX3CR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CX3CR1 BINDING SITE, designated SEQ ID:15434, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17194] Another function of GAM99 is therefore inhibition of Chemokine (c-x3-c motif) receptor 1 (CX3CR1, Accession NP_001328.1), a gene which mediates both the adhesive and migratory functions of fractalkine and therefore may be associated with Human immunodeficiency virus type 1. Accordingly, utilities of GAM99 include diagnosis, preven-

tion and treatment of Human immunodeficiency virus type 1., and of other diseases and clinical conditions associated with CX3CR1.

[17195] The function of CX3CR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Chemokine (c-x-c motif) ligand 9 (CXCL9, Accession NP_002407.1) is another GAM99 target gene, herein designated TARGET GENE. CXCL9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CXCL9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CXCL9 BINDING SITE, designated SEQ ID:5355, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17196] Another function of GAM99 is therefore inhibition of Chemokine (c-x-c motif) ligand 9 (CXCL9, Accession NP_002407.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL9.

[17197] CYP20A1 (Accession NP_065725.2) is another GAM99 tar-

get gene, herein designated TARGET GENE. CYP20A1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CYP20A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP20A1 BINDING SITE, designated SEQ ID:6915, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17198] Another function of GAM99 is therefore inhibition of CYP20A1 (Accession NP_065725.2) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP20A1.

[17199] DARP (Accession NP_659431.3) is another GAM99 target gene, herein designated TARGET GENE. DARP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DARP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DARP BINDING SITE, designated SEQ ID:10261, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17200] Another function of GAM99 is therefore inhibition of DARP (Accession NP_659431.3) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DARP.

[17201] Dynactin 1 (p150, glued homolog, drosophila) (DCTN1, Accession NP_004073.2) is another GAM99 target gene, herein designated TARGET GENE. DCTN1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DCTN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCTN1 BINDING SITE, designated SEQ ID:11619, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17202] Another function of GAM99 is therefore inhibition of Dynactin 1 (p150, glued homolog, drosophila) (DCTN1, Accession NP_004073.2), a gene which is a microtubule-based biologic motor protein. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCTN1.

[17203] The function of DCTN1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM47.1.Deiodinase, iodothyronine, type i (DIO1, Accession NP_000783.2) is another GAM99 target gene, herein designated TARGET GENE. DIO1 BINDING SITE1 and DIO1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DIO1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DIO1 BINDING SITE1 and DIO1 BINDING SITE2, designated SEQ ID:1704 and SEQ ID:6987 respectively, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17204] Another function of GAM99 is therefore inhibition of Deiodinase, iodothyronine, type i (DIO1, Accession NP_000783.2) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO1.

[17205] DKFZp313M0720 (Accession XP_113743.3) is another GAM99 target gene, herein designated TARGET GENE. DKFZp313M0720 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp313M0720, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp313M0720 BINDING SITE, designated SEQ ID:13887, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17206] Another function of GAM99 is therefore inhibition of DKFZp313M0720 (Accession XP_113743.3) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp313M0720.

[17207] DKFZp434A2417 (Accession NP_663736.1) is another GAM99 target gene, herein designated TARGET GENE. DKFZp434A2417 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434A2417, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434A2417 BINDING SITE, designated SEQ ID:20081, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17208] Another function of GAM99 is therefore inhibition of DK-

FZp434A2417 (Accession NP_663736.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434A2417.

[17209] Fat tumor suppressor homolog 2 (drosophila) (FAT2, Accession NP_001438.1) is another GAM99 target gene, herein designated TARGET GENE. FAT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FAT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FAT2 BINDING SITE, designated SEQ ID:1177, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17210] Another function of GAM99 is therefore inhibition of Fat tumor suppressor homolog 2 (drosophila) (FAT2, Accession NP_001438.1), a gene which could function as a cell-adhesion protein. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAT2.

[17211] The function of FAT2 has been established by previous studies. The domain that characterizes epidermal growth

factor (EGF; 131530) consists of approximately 50 amino acids with 3 disulfide bonds. EGF- like domains are believed to play a critical role in a number of extracellular events, including cell adhesion and receptor- ligand interactions. Proteins with EGF- like domains often consist of more than 1,000 amino acids, have multiple copies of the EGF- like domain, and contain additional domains known to be involved in specific protein- protein interactions. To identify proteins containing EGF- like domains, Nakayama et al. (1998) searched a database of long cDNA sequences randomly selected from a human brain cDNA library for those that encode an EGF- like motif. They identified several partial cDNAs encoding novel proteins with EGF- like domains, such as FAT2, which they named MEGF1. Nakayama et al. (1998) isolated a rat cDNA containing the complete Megf1 coding sequence. The predicted Megf1 protein has a signal sequence, 34 cadherin motifs (see OMIM Ref. No. 603006), a laminin G domain (see OMIM Ref. No. 601033), 2 EGF- like domains, a transmembrane domain, a cytoplasmic proline- rich sequence, and a cytoplasmic RGD (arginine- glycine- aspartic acid) motif, which is found in proteins modulating cell adhesion. The predicted structure of Megf1 is similar overall to the

structures of the Drosophila 'fat' gene product and human FAT (OMIM Ref. No. 600976), although the number of EGF- like domains varies among these proteins. The Drosophila fat gene is a tumor suppressor gene whose product controls cell proliferation and morphogenesis in the imaginal discs in a contact- dependent manner. Northern blot analysis of various regions of rat brain de- tected Megf1 expression only in the cerebellum.

[17212]

[17213] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17214] Nakayama, M.; Nakajima, D.; Nagase, T.; Nomura, N.; Seki, N.; Ohara, O. : Identification of high- molecular- weight proteins with multiple EGF- like motifs by motif- trap screening. Genomics 51: 27- 34, 1998. ; and

[17215] Wu, Q.; Maniatis, T. : Large exons encoding multiple ectodomains are a characteristic feature of protocadherin genes. Proc. Nat. Acad. Sci. 97: 3124- 3129, 2000.

[17216] Further studies establishing the function and utilities of FAT2 are found in John Hopkins OMIM database record ID 604269, and in cited publications listed in Table 5, which are hereby incorporated by reference.F-box and leucine-

rich repeat protein 5 (FBXL5, Accession NP_036293.1) is another GAM99 target gene, herein designated TARGET GENE. FBXL5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXL5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXL5 BINDING SITE, designated SEQ ID:15662, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17217] Another function of GAM99 is therefore inhibition of F-box and leucine-rich repeat protein 5 (FBXL5, Accession NP_036293.1), a gene which is a putative SCF ubiquitin ligase subunit involved in protein degradation. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL5.

[17218] The function of FBXL5 has been established by previous studies. The F box, named after cyclin F (CCNF; 600227), in which it was originally observed, is an approximately 40- amino acid motif that binds SKP1 (OMIM Ref. No. 601434). F- box proteins are components of modular E3

ubiquitin protein ligases called SCFs (SKP1, OMIM Ref. No. 603134), F- box proteins), which function in phosphory- lation- dependent ubiquitination. Using a yeast 2- hybrid screen with SKP1 as bait, followed by searching sequence databases, Winston et al. (1999) and Cenciarelli et al. (1999) identified 33 mammalian and 26 human F- box proteins, respectively. These contained C termini with leucine- rich repeats (FBXLs, e.g., SKP2 (OMIM Ref. No. 601436)), WD40 domains (FBXWs, e.g., BTRCP (OMIM Ref. No. 603482)), or no recognizable motifs (FBXOs, e.g., CCNF). Winston et al. (1999) predicted the presence of 6 leucine- rich repeats (LRRs) in FBXL5. RT- PCR analysis detected expression in all tissues tested, with highest lev- els in heart and pancreas.

[17219]

[17220] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17221] Ilyin, G. P.; Rialland, M.; Pigeon, C.; Guguen- Guillouzo, C. : cDNA cloning and expression analysis of new members of the mammalian F- box protein family. Genomics 67: 40- 47, 2000. ; and

No. 601436)), WD40 domains (FBXWs, e.g., BTRCP (OMIM Ref. No. 603482)), or no recognizable motifs (FBXOs, e.g., CCNF). Winston et al. (1999) predicted the presence of 6 leucine- rich repeats (LRRs) in FBXL5. RT- PCR analysis detected expression in all tissues tested, with highest lev- els in heart and pancreas.

[17226]

[17227] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[17228] Ilyin, G. P.; Rialland, M.; Pigeon, C.; Guguen- Guillouzo, C. : cDNA cloning and expression analysis of new members of the mammalian F- box protein family. Genomics 67: 40- 47, 2000. ; and

[17229] Winston, J. T.; Koepp, D. M.; Zhu, C.; Elledge, S. J.; Harper, J. W. : A family of mammalian F- box proteins. Curr. Biol. 9: 1180- 1182, 1999.

[17230] Further studies establishing the function and utilities of FBXL5 are found in John Hopkins OMIM database record ID 605655, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ10204 (Accession NP_060494.1) is another GAM99 target gene, herein designated TARGET GENE. FLJ10204 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10204, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10204 BINDING SITE, designated SEQ ID:16040, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17231] Another function of GAM99 is therefore inhibition of

FLJ10204 (Accession NP_060494.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10204.

[17232] FLJ10330 (Accession NP_060531.1) is another GAM99 target gene, herein designated TARGET GENE. FLJ10330 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10330, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10330 BINDING SITE, designated SEQ ID:8822, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17233] Another function of GAM99 is therefore inhibition of FLJ10330 (Accession NP_060531.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10330.

[17234] FLJ10769 (Accession NP_060680.1) is another GAM99 target gene, herein designated TARGET GENE. FLJ10769 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10769, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ10769 BINDING SITE, designated SEQ ID:14541, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17235] Another function of GAM99 is therefore inhibition of FLJ10769 (Accession NP_060680.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10769.

[17236] FLJ11269 (Accession NP_060842.2) is another GAM99 target gene, herein designated TARGET GENE. FLJ11269 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11269, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11269 BINDING SITE, designated SEQ ID:19814, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17237] Another function of GAM99 is therefore inhibition of FLJ11269 (Accession NP_060842.2) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11269.

[17238] FLJ12960 (Accession NP_078914.1) is another GAM99 tar-

get gene, herein designated TARGET GENE. FLJ12960 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12960, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12960 BINDING SITE, designated SEQ ID:4577, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17239] Another function of GAM99 is therefore inhibition of FLJ12960 (Accession NP_078914.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12960.

[17240] FLJ13397 (Accession NP_079224.1) is another GAM99 target gene, herein designated TARGET GENE. FLJ13397 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13397, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13397 BINDING SITE, designated SEQ ID:4021, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17241] Another function of GAM99 is therefore inhibition of FLJ13397 (Accession NP_079224.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13397.

[17242] FLJ14721 (Accession NP_116218.1) is another GAM99 target gene, herein designated TARGET GENE. FLJ14721 BINDING SITE1 and FLJ14721 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ14721, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14721 BINDING SITE1 and FLJ14721 BINDING SITE2, designated SEQ ID:14815 and SEQ ID:16399 respectively, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17243] Another function of GAM99 is therefore inhibition of FLJ14721 (Accession NP_116218.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14721.

[17244] FLJ20898 (Accession NP_078876.1) is another GAM99 target gene, herein designated TARGET GENE. FLJ20898 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by FLJ20898, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20898 BINDING SITE, designated SEQ ID:5699, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17245] Another function of GAM99 is therefore inhibition of FLJ20898 (Accession NP_078876.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20898.

[17246] FLJ20986 (Accession NP_078800.2) is another GAM99 target gene, herein designated TARGET GENE. FLJ20986 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20986, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20986 BINDING SITE, designated SEQ ID:5649, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17247] Another function of GAM99 is therefore inhibition of FLJ20986 (Accession NP_078800.2) . Accordingly, utilities

of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20986.

[17248] FLJ23129 (Accession NP_079039.1) is another GAM99 target gene, herein designated TARGET GENE. FLJ23129 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23129, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23129 BINDING SITE, designated SEQ ID:15636, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17249] Another function of GAM99 is therefore inhibition of FLJ23129 (Accession NP_079039.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23129.

[17250] FLJ32932 (Accession NP_690873.1) is another GAM99 target gene, herein designated TARGET GENE. FLJ32932 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32932, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ32932 BINDING SITE, designated SEQ ID:1197, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17251] Another function of GAM99 is therefore inhibition of FLJ32932 (Accession NP_690873.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32932.

[17252] FLJ33167 (Accession NP_689896.1) is another GAM99 target gene, herein designated TARGET GENE. FLJ33167 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ33167, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33167 BINDING SITE, designated SEQ ID:20132, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17253] Another function of GAM99 is therefore inhibition of FLJ33167 (Accession NP_689896.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33167.

[17254] Glucose-6-phosphatase, catalytic (glycogen storage disease type i, von gierke disease) (G6PC, Accession

NP_000142.1) is another GAM99 target gene, herein designated TARGET GENE. G6PC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by G6PC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of G6PC BINDING SITE, designated SEQ ID:3569, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17255] Another function of GAM99 is therefore inhibition of Glucose-6-phosphatase, catalytic (glycogen storage disease type i, von gierke disease) (G6PC, Accession NP_000142.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PC.

[17256] Group-specific component (vitamin d binding protein) (GC, Accession NP_000574.1) is another GAM99 target gene, herein designated TARGET GENE. GC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GC BINDING

SITE, designated SEQ ID:2597, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17257] Another function of GAM99 is therefore inhibition of Group-specific component (vitamin d binding protein) (GC, Accession NP_000574.1), a gene which transports vitamin D and its plasma metabolites to target tissues. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GC.

[17258] The function of GC has been established by previous studies. Chapman et al. (1997) found that the mouse Gbx2 gene contains a single intron, a feature of the human GBX2 gene. They mapped Gbx2 to mouse chromosome 1. They extended the known expression pattern of Gbx2 beyond the gastrulation- stage embryo and the developing CNS to pluripotent cells in vitro and in vivo. Gbx2 expression was demonstrated in undifferentiated embryonic stem cells but was downregulated in differentiated cell populations. In the embryo, Gbx2 expression was detected before primitive streak formation, in the inner cell mass of the preimplantation embryo. Chapman et al. (1997) suggested Gbx2 as a candidate control gene for

cell pluripotency and differentiation in the embryo.

[17259] Animal model experiments lend further support to the function of GC. The mid/hindbrain junction can act as an organizer to direct the development of the midbrain and anterior hindbrain. In mice, Otx2 (OMIM Ref. No. 600037) is expressed in the forebrain and midbrain and Gbx2 is expressed in the anterior hindbrain, with a shared border at the level of the mid/hindbrain organizer. Millet et al. (1999) demonstrated that in Gbx2 - /- mutants, the earliest phenotype is a posterior expansion of the Otx2 domain during early somite stages. Furthermore, organizer genes are expressed at the shifted Otx2 border, but not in a normal spatial relationship. To test whether Gbx2 is sufficient to position the mid/hindbrain organizer, Millet et al. (1999) transiently expressed Gbx2 in the caudal Otx2 domain and found that the Otx2 caudal border was indeed shifted rostrally, and a normal- appearing organizer formed at this new Otx2 border. Transgenic embryos then showed an expanded hindbrain and a reduced midbrain at embryonic day 9.5 to 10. Millet et al. (1999) proposed that the formation of a normal mid/hindbrain organizer depends on a sharp Otx2 caudal border and that Gbx2 is required to position and sharpen this border.

[17260] It is appreciated that the abovementioned animal model for GC is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17261] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17262] Svasti, J.; Kurosky, A.; Bennett, A.; Bowman, B. H. : Molecular basis for the three major forms of human serum vitamin D binding protein (group- specific component). Biochemistry 18: 1611- 1617, 1979. ; and

[17263] Millet, S.; Campbell, K.; Epstein, D. J.; Losos, K.; Harris, E.; Joyner, A. L. : A role for Gbx2 in repression of Otx2 and positioning the mid/hindbrain organizer. Nature 401: 161- 164, 19.

[17264] Further studies establishing the function and utilities of GC are found in John Hopkins OMIM database record ID 139200, and in cited publications listed in Table 5, which are hereby incorporated by reference.Gap junction protein, beta 6 (connexin 30) (GJB6, Accession NP_006774.1) is another GAM99 target gene, herein designated TARGET GENE. GJB6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GJB6,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GJB6 BINDING SITE, designated SEQ ID:18208, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17265] Another function of GAM99 is therefore inhibition of Gap junction protein, beta 6 (connexin 30) (GJB6, Accession NP_006774.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJB6.

[17266] Glycoprotein v (platelet) (GP5, Accession NP_004479.1) is another GAM99 target gene, herein designated TARGET GENE. GP5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GP5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GP5 BINDING SITE, designated SEQ ID:15292, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17267] Another function of GAM99 is therefore inhibition of Glycoprotein v (platelet) (GP5, Accession NP_004479.1) . Ac-

cordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GP5.

[17268] Glycoprotein (transmembrane) nmb (GPNMB, Accession NP_002501.1) is another GAM99 target gene, herein designated TARGET GENE. GPNMB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPNMB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPNMB BINDING SITE, designated SEQ ID:2512, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17269] Another function of GAM99 is therefore inhibition of Glycoprotein (transmembrane) nmb (GPNMB, Accession NP_002501.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPNMB.

[17270] G protein-coupled receptor 18 (GPR18, Accession NP_005283.1) is another GAM99 target gene, herein designated TARGET GENE. GPR18 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GPR18, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR18 BINDING SITE, designated SEQ ID:4838, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17271] Another function of GAM99 is therefore inhibition of G protein-coupled receptor 18 (GPR18, Accession NP_005283.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR18.

[17272] Huntingtin-associated protein interacting protein (duo) (HAPIP, Accession NP_003938.1) is another GAM99 target gene, herein designated TARGET GENE. HAPIP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HAPIP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HAPIP BINDING SITE, designated SEQ ID:10617, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17273] Another function of GAM99 is therefore inhibition of Huntingtin-associated protein interacting protein (duo)

(HAPIP, Accession NP_003938.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAPIP.

[17274] Homeo box a1 (HOXA1, Accession NP_705873.1) is another GAM99 target gene, herein designated TARGET GENE. HOXA1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HOXA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXA1 BINDING SITE, designated SEQ ID:9804, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17275] Another function of GAM99 is therefore inhibition of Homeo box a1 (HOXA1, Accession NP_705873.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXA1.

[17276] Islet cell autoantigen 1, 69kda (ICA1, Accession NP_071682.1) is another GAM99 target gene, herein designated TARGET GENE. ICA1 BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by ICA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ICA1 BINDING SITE, designated SEQ ID:6344, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17277] Another function of GAM99 is therefore inhibition of Islet cell autoantigen 1, 69kda (ICA1, Accession NP_071682.1), a gene which encodes Islet cell autoantigen 1 and therefore may be associated with Insulin- dependent diabetes mellitus. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Insulin- dependent diabetes mellitus, and of other diseases and clinical conditions associated with ICA1.

[17278] The function of ICA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM94.1.Interleukin 1 family, member 10 (theta) (IL1F10, Accession NP_115945.4) is another GAM99 target gene, herein designated TARGET GENE. IL1F10 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by

IL1F10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL1F10 BINDING SITE, designated SEQ ID:8455, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17279] Another function of GAM99 is therefore inhibition of Interleukin 1 family, member 10 (theta) (IL1F10, Accession NP_115945.4) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1F10.

[17280] Interleukin enhancer binding factor 2, 45kda (ILF2, Accession NP_004506.2) is another GAM99 target gene, herein designated TARGET GENE. ILF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ILF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ILF2 BINDING SITE, designated SEQ ID:9869, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17281] Another function of GAM99 is therefore inhibition of Interleukin enhancer binding factor 2, 45kda (ILF2, Acces-

sion NP_004506.2) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ILF2.

[17282] INHBE (Accession NP_113667.1) is another GAM99 target gene, herein designated TARGET GENE. INHBE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by INHBE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of INHBE BINDING SITE, designated SEQ ID:2641, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17283] Another function of GAM99 is therefore inhibition of INHBE (Accession NP_113667.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INHBE.

[17284] Iron-responsive element binding protein 2 (IREB2, Accession XP_039114.2) is another GAM99 target gene, herein designated TARGET GENE. IREB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IREB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IREB2 BINDING SITE, designated SEQ ID:10640, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17285] Another function of GAM99 is therefore inhibition of Iron-responsive element binding protein 2 (IREB2, Accession XP_039114.2), a gene which binds mRNAs that contain iron- responsive elements. and therefore may be associated with Misregulation of iron metabolism and neurodegenerative disease. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Misregulation of iron metabolism and neurodegenerative disease, and of other diseases and clinical conditions associated with IREB2.

[17286] The function of IREB2 has been established by previous studies. Rouault et al. (1990) identified a second IRE-binding protein, for which the degenerate screening of the oligonucleotide used in identifying the cDNA for IREB1 (OMIM Ref. No. 100880) also served as a successful sequencing primer. The second IREBP, represented by 'clone 10.1,' contained an inserted stretch of 73 amino acids between amino acids 37 and 38 of IREB1; the IREB2 gene product lacked a region homologous to the sequences

between amino acids 436 and 470 of IREB1. Wu et al. (1999) demonstrated that the c- myc (OMIM Ref. No. 190080) protein stimulates expression of IRP2. Hentze and Kuhn (1996) reviewed the function of IRP2. IRP2 is less abundant than IRP1 (IREB1) in most cells. The strongest expression is in intestine and brain (Henderson et al., 1993). Human IRP2 is 57% identical to human IRP1. IRP2 has a molecular mass of 105 kD, which is slightly larger than that of IRP1 due to a 73- amino acid insertion. Iwai et al. (1995) demonstrated that the 73- amino acid insertion mediates IRP2 degradation in iron- replete cells. Guo et al. (1994) and Samaniego et al. (1994) showed that IRP2 has no aconitase activity. By Southern analysis of somatic cell hybrid DNAs, Rouault et al. (1990) assigned the IREB2 gene to chromosome 15.

[17287] Animal model experiments lend further support to the function of IREB2. LaVaute et al. (2001) showed that in mice, targeted disruption of the Ireb2 gene resulted in misregulation of iron metabolism in the intestinal mucosa and neurodegenerative disease of the central nervous system. In adulthood, Ireb2 - /- mice developed a movement disorder characterized by ataxia, bradykinesia, and tremor. Significant accumulations of iron in white matter

tracts and nuclei throughout the brain preceded the onset of neurodegeneration and movement disorder symptoms by many months. Ferric iron accumulated in the cytosol of neurons and oligodendrocytes in distinctive regions of the brain. Abnormal accumulations of ferritin colocalized with iron accumulations in populations of neurons that degenerated. Ireb2 - /- mice initially grew and developed normally. Mice older than 6 months of age developed a progressive neurodegenerative disorder characterized initially by an unsteady, wide- based gait and subtle kyphosis followed by gradual onset of ataxia, vestibular dysfunction, tremor, bradykinesia, and postural abnormalities. Balance and grip strength measured using the hanging wire test indicated severe impairment, whereas heterozygous mice showed an intermediate degree of impairment

[17288] It is appreciated that the abovementioned animal model for IREB2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17289] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17290] Hentze, M. W.; Kuhn, L. C. : Molecular control of verte-

brate iron metabolism: mRNA- based regulatory circuits operated by iron, nitric oxide, and oxidative stress. Proc. Nat. Acad. Sci. 93: 8175- 8182, 1996. ; and

[17291] LaVaute, T.; Smith, S.; Cooperman, S.; Iwai, K.; Land, W.; Meyron- Holtz, E.; Drake, S. K.; Miller, G.; Abu- Asab, M.; Tsokos, M.; Switzer, R., III; Grinberg, A.; Love, P.; Tresser, N.; Ro.

[17292] Further studies establishing the function and utilities of IREB2 are found in John Hopkins OMIM database record ID 147582, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interferon regulatory factor 4 (IRF4, Accession NP_002451.1) is another GAM99 target gene, herein designated TARGET GENE. IRF4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IRF4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IRF4 BINDING SITE, designated SEQ ID:13735, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17293] Another function of GAM99 is therefore inhibition of Interferon regulatory factor 4 (IRF4, Accession

NP_002451.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRF4.

[17294] Junction plakoglobin (JUP, Accession NP_068831.1) is another GAM99 target gene, herein designated TARGET GENE. JUP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by JUP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JUP BINDING SITE, designated SEQ ID:3039, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17295] Another function of GAM99 is therefore inhibition of Junction plakoglobin (JUP, Accession NP_068831.1), a gene which plays a central role in the structure and function of submembranous plaques. and therefore may be associated with Naxos disease. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Naxos disease, and of other diseases and clinical conditions associated with JUP.

[17296] The function of JUP has been established by previous studies. Plakoglobin is a major cytoplasmic protein that

occurs in a soluble and a membrane- associated form and is the only known constituent common to the submembranous plaques of both kinds of adhering junctions, the desmosomes and the intermediate junctions. It is a desmoplakin (see OMIM Ref. No. 125647) and is referred to as DP III. DP I and DP II are splice variants of the same gene. Using a partial cDNA clone for bovine plakoglobin, Franke et al. (1989) isolated cDNAs encoding human plakoglobin, determined its nucleotide sequence, and deduced the complete amino acid sequence. The polypeptide encoded by the cDNA was synthesized by in vitro transcription and translation and identified by its comigration with authentic plakoglobin in 2- dimensional gel electrophoresis. The protein, which has 744 amino acids and a molecular weight of 81,750 Da, is unrelated to any known protein and is highly conserved between human and bovine tissues. Only one kind of plakoglobin mRNA (OMIM Ref. No. 3.4 kb) was found in most tissues, but an additional mRNA (OMIM Ref. No. 3.7 kb) was detected in certain human tumor cell lines. Arnemann et al. (1991) established a PCR assay for the gene coding for plakoglobin and used it to test human/mouse and human/rat somatic cell hybrids with different contents of

human chromosomes. In this way, they were able to assign DP3 to chromosome 7. By analysis of progeny from 2 interspecific backcrosses, Guenet et al. (1995) mapped the Jup gene to mouse chromosome 11. Thus, the human JUP gene is probably on 7p because that is the portion of the chromosome showing homology of synteny to mouse 11. However, mouse 11 shows much more extensive homology to human chromosome 17 and, indeed, studies using both Southern blot analysis of human/rodent cell hybrids and linkage studies with an intragenic polymorphism demonstrated that the plakoglobin gene is located on 17q21 (Aberle OMIM Ref. No. later). Using a monochromosomal human- rodent somatic cell hybrid panel, Cowley et al. (1997) likewise showed that the JUP gene is located on chromosome 17. McKoy et al. (2000) identified a 2- basepair deletion in homozygous state in the plakoglobin gene in individuals affected with Naxos disease (OMIM Ref. No. 601214). Western blot analysis showed that the mutation causes a frameshift and premature termination of the protein. The finding of a deletion in plakoglobin in arrhythmogenic right ventricular cardiomyopathy suggests that the proteins involved in cell-cell adhesion play an important role in maintaining my-

ocyte integrity and that when junctions are disrupted, cell death with fatty and fibrous tissue replacement occurs. Nomenclature: Since the term plakoglobin is in increasingly accepted usage, it may be desirable to have a gene symbol that is closer to it, e.g., PKGB. Although the development of gene symbols that reflect families of proteins (and genes) to which the entity belongs has some justification, it can be confusing. The symbol JUP is derived from junction plakoglobin.

[17297] Animal model experiments lend further support to the function of JUP. Ruiz et al. (1996) generated mice deficient in plakoglobin by targeted disruption. Plakoglobin mutant mouse embryos showed decreased myofiber compliance and reduced cell- cell adhesion as a result of defects in the number and structure of desmosomes within the myocardium. Consequently, when myocardial cells undergo increased mechanical stress, e.g., at embryonic day 10.5 from the onset of embryonic blood circulation, the mice die from ventricular rupture. Plakoglobin- deficient C57BL/6 mice that survive longer, to around birth, show an additional skin phenotype. Epidermal desmosomes of these mice are disorganized and detached from the cytokeratin filaments, presenting features similar to the hu-

man blistering disease epidermolytic hyperkeratosis

[17298] It is appreciated that the abovementioned animal model for JUP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17299] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17300] Bierkamp, C.; Mclaughlin, K. J.; Schwarz, H.; Huber, O.; Kemler, R. : Embryonic heart and skin defects in mice lacking plakoglobin. Dev. Biol. 180: 780- 785, 1996. ; and

[17301] McKoy, G.; Protonotarios, N.; Crosby, A.; Tsatsopoulou, A.; Anastasakis, A.; Coonar, A.; Norman, M.; Baboonian, C.; Jeffery, S.; McKenna, W. J. : Identification of a deletion in plakogl.

[17302] Further studies establishing the function and utilities of JUP are found in John Hopkins OMIM database record ID 173325, and in cited publications listed in Table 5, which are hereby incorporated by reference.Junction plakoglobin (JUP, Accession NP_002221.1) is another GAM99 target gene, herein designated TARGET GENE. JUP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by JUP, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JUP BINDING SITE, designated SEQ ID:3039, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17303] Another function of GAM99 is therefore inhibition of Junction plakoglobin (JUP, Accession NP_002221.1), a gene which plays a central role in the structure and function of submembranous plaques. and therefore may be associated with Naxos disease. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Naxos disease, and of other diseases and clinical conditions associated with JUP.

[17304] The function of JUP has been established by previous studies. Plakoglobin is a major cytoplasmic protein that occurs in a soluble and a membrane- associated form and is the only known constituent common to the submembranous plaques of both kinds of adhering junctions, the desmosomes and the intermediate junctions. It is a desmoplakin (see OMIM Ref. No. 125647) and is referred to as DP III. DP I and DP II are splice variants of the same gene. Using a partial cDNA clone for bovine plakoglobin,

Franke et al. (1989) isolated cDNAs encoding human plakoglobin, determined its nucleotide sequence, and deduced the complete amino acid sequence. The polypeptide encoded by the cDNA was synthesized by in vitro transcription and translation and identified by its comigration with authentic plakoglobin in 2- dimensional gel electrophoresis. The protein, which has 744 amino acids and a molecular weight of 81,750 Da, is unrelated to any known protein and is highly conserved between human and bovine tissues. Only one kind of plakoglobin mRNA (OMIM Ref. No. 3.4 kb) was found in most tissues, but an additional mRNA (OMIM Ref. No. 3.7 kb) was detected in certain human tumor cell lines. Arnemann et al. (1991) established a PCR assay for the gene coding for plakoglobin and used it to test human/mouse and human/rat somatic cell hybrids with different contents of human chromosomes. In this way, they were able to assign DP3 to chromosome 7. By analysis of progeny from 2 interspecific backcrosses, Guenet et al. (1995) mapped the Jup gene to mouse chromosome 11. Thus, the human JUP gene is probably on 7p because that is the portion of the chromosome showing homology of synteny to mouse 11. However, mouse 11 shows much more extensive ho-

mology to human chromosome 17 and, indeed, studies using both Southern blot analysis of human/rodent cell hybrids and linkage studies with an intragenic polymorphism demonstrated that the plakoglobin gene is located on 17q21 (Aberle OMIM Ref. No. later). Using a monochromosomal human- rodent somatic cell hybrid panel, Cowley et al. (1997) likewise showed that the JUP gene is located on chromosome 17. McKoy et al. (2000) identified a 2- basepair deletion in homozygous state in the plakoglobin gene in individuals affected with Naxos disease (OMIM Ref. No. 601214). The finding of a deletion in plakoglobin in arrhythmogenic right ventricular cardiomyopathy suggests that the proteins involved in cell-cell adhesion play an important role in maintaining myocyte integrity and that when junctions are disrupted, cell death with fatty and fibrous tissue replacement occurs. Nomenclature: Since the term plakoglobin is in increasingly accepted usage, it may be desirable to have a gene symbol that is closer to it, e.g., PKGB. Although the development of gene symbols that reflect families of proteins (and genes) to which the entity belongs has some justifi-

cation, it can be confusing. The symbol JUP is derived from junction plakoglobin.

[17305] Animal model experiments lend further support to the function of JUP. Ruiz et al. (1996) generated mice deficient in plakoglobin by targeted disruption. Plakoglobin mutant mouse embryos showed decreased myofiber compliance and reduced cell- cell adhesion as a result of defects in the number and structure of desmosomes within the myocardium. Consequently, when myocardial cells undergo increased mechanical stress, e.g., at embryonic day 10.5 from the onset of embryonic blood circulation, the mice die from ventricular rupture. Plakoglobin- deficient C57BL/6 mice that survive longer, to around birth, show an additional skin phenotype. Epidermal desmosomes of these mice are disorganized and detached from the cytokeratin filaments, presenting features similar to the human blistering disease epidermolytic hyperkeratosis

[17306] It is appreciated that the abovementioned animal model for JUP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17307] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[17308] Bierkamp, C.; Mclaughlin, K. J.; Schwarz, H.; Huber, O.; Kemler, R. : Embryonic heart and skin defects in mice lacking plakoglobin. Dev. Biol. 180: 780- 785, 1996. ; and

[17309] McKoy, G.; Protonotarios, N.; Crosby, A.; Tsatsopoulou, A.; Anastasakis, A.; Coonar, A.; Norman, M.; Baboonian, C.; Jeffery, S.; McKenna, W. J. : Identification of a deletion in plakogl.

[17310] Further studies establishing the function and utilities of JUP are found in John Hopkins OMIM database record ID 173325, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0638 (Accession XP_290497.1) is another GAM99 target gene, herein designated TARGET GENE. KIAA0638 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0638, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0638 BINDING SITE, designated SEQ ID:9348, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17311] Another function of GAM99 is therefore inhibition of

KIAA0638 (Accession XP_290497.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0638.

[17312] KIAA0841 (Accession XP_049237.1) is another GAM99 target gene, herein designated TARGET GENE. KIAA0841 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0841, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE, designated SEQ ID:1976, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17313] Another function of GAM99 is therefore inhibition of KIAA0841 (Accession XP_049237.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841.

[17314] KIAA1068 (Accession NP_056147.1) is another GAM99 target gene, herein designated TARGET GENE. KIAA1068 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1068, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1068 BINDING SITE, designated SEQ ID:18247, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17315] Another function of GAM99 is therefore inhibition of KIAA1068 (Accession NP_056147.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1068.

[17316] KIAA1107 (Accession XP_034086.1) is another GAM99 target gene, herein designated TARGET GENE. KIAA1107 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1107, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1107 BINDING SITE, designated SEQ ID:18484, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17317] Another function of GAM99 is therefore inhibition of KIAA1107 (Accession XP_034086.1) . Accordingly, utilities

of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1107.

[17318] KIAA1193 (Accession XP_041843.1) is another GAM99 target gene, herein designated TARGET GENE. KIAA1193 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1193, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1193 BINDING SITE, designated SEQ ID:10805, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17319] Another function of GAM99 is therefore inhibition of KIAA1193 (Accession XP_041843.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1193.

[17320] KIAA1576 (Accession NP_065978.1) is another GAM99 target gene, herein designated TARGET GENE. KIAA1576 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1576, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1576 BINDING SITE, designated SEQ ID:9853, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17321] Another function of GAM99 is therefore inhibition of KIAA1576 (Accession NP_065978.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1576.

[17322] KIAA1911 (Accession XP_056302.1) is another GAM99 target gene, herein designated TARGET GENE. KIAA1911 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1911, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1911 BINDING SITE, designated SEQ ID:14728, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17323] Another function of GAM99 is therefore inhibition of KIAA1911 (Accession XP_056302.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KIAA1911.

[17324] KIAA1940 (Accession XP_086981.2) is another GAM99 target gene, herein designated TARGET GENE. KIAA1940 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1940, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1940 BINDING SITE, designated SEQ ID:13001, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17325] Another function of GAM99 is therefore inhibition of KIAA1940 (Accession XP_086981.2) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1940.

[17326] Kinesin family member 1b (KIF1B, Accession NP_055889.1) is another GAM99 target gene, herein designated TARGET GENE. KIF1B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIF1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIF1B BINDING SITE, designated SEQ ID:5704, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17327] Another function of GAM99 is therefore inhibition of Kinesin family member 1b (KIF1B, Accession NP_055889.1), a gene which motor for anterograde transport of mitochondria. has a microtubule plus end- directed motility. and therefore is associated with Charcot- marie- tooth disease, neuronal type, a. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Charcot-marie- tooth disease, neuronal type, a, and of other diseases and clinical conditions associated with KIF1B.

[17328] The function of KIF1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM72.1.Klotho (KL, Accession NP_710150.1) is another GAM99 target gene, herein designated TARGET GENE. KL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of

the nucleotide sequences of KL BINDING SITE, designated SEQ ID:7411, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17329] Another function of GAM99 is therefore inhibition of Klotho (KL, Accession NP_710150.1), a gene which has similarity to beta- glucosidases. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KL.

[17330] The function of KL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM48.2.Kallikrein 5 (KLK5, Accession NP_036559.1) is another GAM99 target gene, herein designated TARGET GENE. KLK5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KLK5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLK5 BINDING SITE, designated SEQ ID:1827, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17331] Another function of GAM99 is therefore inhibition of Kallikrein 5 (KLK5, Accession NP_036559.1), a gene which

may be involved in desquamation. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK5.

[17332] The function of KLK5 has been established by previous studies. Kallikreins, a subgroup of serine proteases, have diverse physiologic functions in many tissues. For additional background information on kallikreins, see 147960. The stratum corneum, the outermost layer of the skin, provides chemical and mechanical resistance. The layer is derived from anucleated, anabolically dead corneocytes that are differentiated from a subset of proliferating keratinocytes. After a 2- to 4- week period, the cells are shed in the process of desquamation. By zymographic analysis of corneocyte extracts, biochemical purification, N- terminal sequencing, database searching, and PCR of a keratinocyte library using degenerate primers, Brattsand and Egelrud (1999) isolated a cDNA encoding KLK5, which they termed SCTE. The deduced 293- amino acid protein contains a signal peptide, a propeptide, and a 227- amino acid catalytically active enzyme with 4 potential N- linked glycosylation sites and conserved serine- protease sites. Northern blot analysis detected a 1.6- kb transcript in a keratinocyte cell line. Western blot analysis showed ex-

pression of proteins ranging from 25 to 37 kD in plantar stratum corneum cells and 40 kD for the recombinant protein. After glycosidase treatment, all samples were expressed as approximately 33- kD proteins. RT- PCR analysis detected strong expression in skin, and after additional amplification, expression was also detected in other tissues, particularly brain, placenta, and kidney. Using a positional candidate approach to identify additional KLK genes on 19q13.3- q13.4, followed by EST database searching and PCR, Yousef and Diamandis (1999) obtained a cDNA encoding KLK5, which they called KLKL2. RT- PCR analysis detected expression primarily in brain, mammary gland, and testis, with lower levels in other tissues. In the presence of estrogens and progestins, KLK5 expression was upregulated in a breast cancer cell line. By genomic sequence analysis, Yousef and Diamandis (1999) determined that the KLK5 gene contains 5 coding exons spanning 9.3 kb on chromosome 19q13.3- q13.4. Harvey et al. (2000) mapped the KLK5 gene to chromosome 19q13.4 in the KLK gene cluster between KLK4 (OMIM Ref. No. 603767) and KLK6 (OMIM Ref. No. 602652). They noted that KLK5 to KLK14 are transcribed telomere to centromere. Kim et al. (2001) noted that KLK5 is ex-

pressed in a subset of ovarian tumors. They found a strong positive correlation between KLK5 expression and tumor grade and disease stage. They concluded that KLK5 expression is associated with more aggressive forms of epithelial ovarian carcinoma

[17333]

[17334] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17335] Kim, H.; Scorillas, A.; Katsaros, D.; Yousef, G. M.; Massobrio, M.; Fracchioli, S.; Piccinno, R.; Gordini, G.; Diamandis, E. P. : Human kallikrein gene 5 (KLK5) expression is an indicator of poor prognosis in ovarian cancer. Brit. J. Cancer 84: 643- 650, 2001. ; and

[17336] Yousef, G. M.; Diamandis, E. P. : The new kallikrein- like gene, KLK- L2: molecular characterization, mapping, tissue expression, and hormonal regulation. J. Biol. Chem. 274: 37511- 37516.

[17337] Further studies establishing the function and utilities of KLK5 are found in John Hopkins OMIM database record ID 605643, and in cited publications listed in Table 5, which are hereby incorporated by reference.Low density lipoprotein receptor (familial hypercholesterolemia) (LDLR, Ac-

cession NP_000518.1) is another GAM99 target gene, herein designated TARGET GENE. LDLR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LDLR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LDLR BINDING SITE, designated SEQ ID:18207, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17338] Another function of GAM99 is therefore inhibition of Low density lipoprotein receptor (familial hypercholesterolemia) (LDLR, Accession NP_000518.1), a gene which also acts as a tumor suppressor. and therefore is associated with Familial hypercholesterolemia. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Familial hypercholesterolemia, and of other diseases and clinical conditions associated with LDLR.

[17339] The function of LDLR has been established by previous studies. The low density lipoprotein receptor is a cell surface receptor that plays an important role in cholesterol homeostasis. The low density lipoprotein receptor is synthesized as a 120- kD glycoprotein precursor that under-

goes change to a 160- kD mature glycoprotein through the covalent addition of a 40- kD protein (Tolleshaug et al., 1982). Yamamoto et al. (1984) reported that the human LDL receptor is an 839- amino acid protein rich in cysteine, with multiple copies of the Alu family of repetitive DNAs. Russell et al. (1984) demonstrated DNA sequence homology of the LDL receptor with the epidermal growth factor receptor (EGF; 131530). Francke et al. (1984) assigned the LDL receptor to chromosome 19 on the basis of expression studies in hamster- human somatic cell hybrids. The LDLR gene was regionalized to 19p13.1- p13.3 by in situ hybridization (Lindgren et al., 1985). Frank et al. (1989) identified RFLPs of the mouse LDL receptor gene and used them to map the gene, designated Ldlr, to the proximal region of chromosome 9. Using interspecific backcrosses, they established the order and interval distances for this and several other loci on mouse chromosome 9, namely, APOA4 (OMIM Ref. No. 107690), which is on chromosome 11 in man, and mannosephosphate isomerase (OMIM Ref. No. 154550), which is on chromosome 15 in man. In a patient with homozygous familial hypercholesterolemia (FH; 143890), Hobbs et al. (1986) described an LDL receptor mutant in which 1

of the 7 repeating units constituting the ligand binding domain had been deleted. The deletion arose by homologous recombination by repetitive Alu sequences in intron 4 and intron 5 of the gene. The deletion removed exon 5, which normally encodes the sixth repeat of the ligand binding domain. In the resultant mRNA, exon 4 was found to be spliced to exon 6, preserving the reading frame. The resulting shortened protein reaches the cell surface and reacts with antireceptor antibodies but does not bind LDL. It does, however, bind VLDL, a lipoprotein that contains apoprotein E as well as apoprotein B- 100. The findings in this instructive case support the hypothesis that the 7 repeated sequences in the receptor constitute the LDL binding domain, that the sixth repeat is required for binding of LDL but not of VLDL, and that deletion of a single repeat can alter the binding specificity of the LDL receptor. Horsthemke et al. (1987) analyzed DNA from 70 patients in the UK with heterozygous familial hypercholesterolemia. In most, the restriction fragment pattern of the LDLR gene was indistinguishable from the normal; however, 3 patients were found to have a deletion of about 1 kb in the central portion of the gene. In 2 patients, the deletion included all or part of exon 5 (606945.0027); in

the third, the deletion included exon 7 (606945.0033). Including a previously described patient with a deletion in the 3- prime part of the gene, these results indicated that 4 out of 70 patients, or 6%, have deletions. Langlois et al. (1988) screened 234 unrelated heterozygotes for FH to detect major rearrangements in the LDLR gene. Total genomic DNA was analyzed by Southern blot hybridization to probes encompassing exons 1 to 18 of the LDLR gene. Six different mutations were detected and characterized by use of exon- specific probes and detailed restriction mapping. The frequency of deletions in the Langlois et al. (1988) study was 2.5% (6 out of 234 patients). An illustration of previously mapped deletions and the deletions identified in this study (a total of 16) suggested that particular areas in the LDLR gene are susceptible to deletion. In a Japanese subject with homozygous hypercholesterolemia, Lehrman et al. (1987) found a 7.8- kb deletion in LDLR (606945.0029). The deletion joined intron 15 to the middle of exon 18, which encodes the 3- prime untranslated region, thereby removing all 3- prime splice acceptor sites distal to intron 15. The mRNA should produce a truncated receptor that lacks the normal membrane- COOH terminus. Rudiger et al. (1991) reviewed

previously described deletions in the LDLR gene in cases of familial hypercholesterolemia and reported the finding of a deletion in 3 of 25 unrelated patients with FH. Defesche and Kastelein (1998) stated that more than 350 different mutations had been found in patients with familial hypercholesterolemia. They tabulated the preferential geographic distribution that has been demonstrated for some of the LDL receptor mutations. For example, in the West of Scotland about half of the index cases of FH were found to have the cys163- to- tyr mutation (606945.0058). Defesche and Kastelein (1998) commented on the geographic associations of LDL receptor mutations within the Netherlands.

[17340]

[17341] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

J.; Leitersdorf, E.; Meiner, V. : Recent origin and spread of a common Lithuanian mutation, G197del LDLR, causing familial hypercholesterolemia: positive selection is not always necessary to ac-

count for disease incidence among Ashkenazi Jews. Am. J. Hum. Genet. 68: 1172- 1188, 2001. ; and

[17343] Rudiger, N. S.; Heinsvig, E. M.; Hansen, F. A.; Faergeman, O.; Bolund, L.; Gregersen, N. : DNA deletions in the low density lipoprotein (LDL) receptor gene in Danish families with fami.

[17344] Further studies establishing the function and utilities of LDLR are found in John Hopkins OMIM database record ID 606945, and in cited publications listed in Table 5, which are hereby incorporated by reference.LOC130589 (Accession NP_620156.1) is another GAM99 target gene, herein designated TARGET GENE. LOC130589 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC130589, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130589 BINDING SITE, designated SEQ ID:15914, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17345] Another function of GAM99 is therefore inhibition of LOC130589 (Accession NP_620156.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130589.

[17346] LOC144486 (Accession XP_096608.1) is another GAM99 target gene, herein designated TARGET GENE. LOC144486 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144486, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144486 BINDING SITE, designated SEQ ID:6916, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17347] Another function of GAM99 is therefore inhibition of LOC144486 (Accession XP_096608.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144486.

[17348] LOC144817 (Accession XP_084972.1) is another GAM99 target gene, herein designated TARGET GENE. LOC144817 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144817, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144817 BINDING SITE, designated SEQ ID:6779, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17349] Another function of GAM99 is therefore inhibition of LOC144817 (Accession XP_084972.1) . Accordingly, utili-

ties of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144817.

[17350] LOC145694 (Accession XP_096838.1) is another GAM99 target gene, herein designated TARGET GENE. LOC145694 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145694, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145694 BINDING SITE, designated SEQ ID:15776, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17351] Another function of GAM99 is therefore inhibition of LOC145694 (Accession XP_096838.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145694.

[17352] LOC148229 (Accession XP_086103.2) is another GAM99 target gene, herein designated TARGET GENE. LOC148229 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148229, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148229 BINDING SITE, designated SEQ ID:15339, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17353] Another function of GAM99 is therefore inhibition of LOC148229 (Accession XP_086103.2) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148229.

[17354] LOC158314 (Accession XP_098920.1) is another GAM99 target gene, herein designated TARGET GENE. LOC158314 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158314, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158314 BINDING SITE, designated SEQ ID:3652, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17355] Another function of GAM99 is therefore inhibition of LOC158314 (Accession XP_098920.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158314.

[17356] LOC170394 (Accession XP_096329.1) is another GAM99 target gene, herein designated TARGET GENE. LOC170394 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC170394, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC170394 BINDING SITE, designated SEQ ID:19448, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17357] Another function of GAM99 is therefore inhibition of LOC170394 (Accession XP_096329.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170394.

[17358] LOC202134 (Accession XP_117365.1) is another GAM99 target gene, herein designated TARGET GENE. LOC202134 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC202134, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC202134 BINDING SITE, designated SEQ ID:19255, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17359] Another function of GAM99 is therefore inhibition of LOC202134 (Accession XP_117365.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202134.

[17360] LOC253187 (Accession XP_173139.1) is another GAM99 target gene, herein designated TARGET GENE. LOC253187 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC253187, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253187 BINDING SITE, designated SEQ ID:7893, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17361] Another function of GAM99 is therefore inhibition of LOC253187 (Accession XP_173139.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC253187.

[17362] LOC255480 (Accession XP_172895.1) is another GAM99 target gene, herein designated TARGET GENE. LOC255480 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC255480, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255480 BINDING SITE, designated SEQ ID:14608, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17363] Another function of GAM99 is therefore inhibition of LOC255480 (Accession XP_172895.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255480.

[17364] LOC283107 (Accession XP_210889.1) is another GAM99 target gene, herein designated TARGET GENE. LOC283107 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283107, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC283107 BINDING SITE, designated SEQ ID:2178, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17365] Another function of GAM99 is therefore inhibition of LOC283107 (Accession XP_210889.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283107.

[17366] LOC283270 (Accession XP_210956.1) is another GAM99 target gene, herein designated TARGET GENE. LOC283270 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283270, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283270 BINDING SITE, designated SEQ ID:19809, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17367] Another function of GAM99 is therefore inhibition of LOC283270 (Accession XP_210956.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283270.

[17368] LOC283633 (Accession XP_208762.1) is another GAM99 target gene, herein designated TARGET GENE. LOC283633 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283633, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283633 BINDING SITE, designated SEQ ID:19415, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17369] Another function of GAM99 is therefore inhibition of LOC283633 (Accession XP_208762.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283633.

[17370] LOC283889 (Accession XP_208899.1) is another GAM99 target gene, herein designated TARGET GENE. LOC283889 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283889, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283889 BINDING SITE, designated SEQ ID:16591, to

the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17371] Another function of GAM99 is therefore inhibition of LOC283889 (Accession XP_208899.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283889.

[17372] LOC284001 (Accession XP_208958.2) is another GAM99 target gene, herein designated TARGET GENE. LOC284001 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284001, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284001 BINDING SITE, designated SEQ ID:10403, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17373] Another function of GAM99 is therefore inhibition of LOC284001 (Accession XP_208958.2) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284001.

[17374] LOC284024 (Accession XP_208970.1) is another GAM99

target gene, herein designated TARGET GENE. LOC284024 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284024 BINDING SITE, designated SEQ ID:5062, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17375] Another function of GAM99 is therefore inhibition of LOC284024 (Accession XP_208970.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284024.

[17376] LOC284344 (Accession XP_209161.1) is another GAM99 target gene, herein designated TARGET GENE. LOC284344 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284344, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284344 BINDING SITE, designated SEQ ID:13243, to the nucleotide sequence of GAM99 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:320.

[17377] Another function of GAM99 is therefore inhibition of LOC284344 (Accession XP_209161.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284344.

[17378] LOC284542 (Accession XP_209254.1) is another GAM99 target gene, herein designated TARGET GENE. LOC284542 BINDING SITE1 and LOC284542 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC284542, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284542 BINDING SITE1 and LOC284542 BINDING SITE2, designated SEQ ID:3690 and SEQ ID:8640 respectively, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17379] Another function of GAM99 is therefore inhibition of LOC284542 (Accession XP_209254.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284542.

[17380] LOC284749 (Accession XP_211623.1) is another GAM99 target gene, herein designated TARGET GENE. LOC284749 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284749, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284749 BINDING SITE, designated SEQ ID:2267, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17381] Another function of GAM99 is therefore inhibition of LOC284749 (Accession XP_211623.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284749.

[17382] LOC284824 (Accession XP_211652.1) is another GAM99 target gene, herein designated TARGET GENE. LOC284824 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284824, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284824 BINDING SITE, designated SEQ ID:3070, to

the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17383] Another function of GAM99 is therefore inhibition of LOC284824 (Accession XP_211652.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284824.

[17384] LOC284899 (Accession XP_211680.1) is another GAM99 target gene, herein designated TARGET GENE. LOC284899 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284899, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284899 BINDING SITE, designated SEQ ID:2009, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17385] Another function of GAM99 is therefore inhibition of LOC284899 (Accession XP_211680.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284899.

[17386] LOC285123 (Accession XP_211773.1) is another GAM99

target gene, herein designated TARGET GENE. LOC285123 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285123, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285123 BINDING SITE, designated SEQ ID:15571, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17387] Another function of GAM99 is therefore inhibition of LOC285123 (Accession XP_211773.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285123.

[17388] LOC285332 (Accession XP_211845.1) is another GAM99 target gene, herein designated TARGET GENE. LOC285332 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285332, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285332 BINDING SITE, designated SEQ ID:3373, to the nucleotide sequence of GAM99 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:320.

[17389] Another function of GAM99 is therefore inhibition of LOC285332 (Accession XP_211845.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285332.

[17390] LOC285366 (Accession XP_209581.1) is another GAM99 target gene, herein designated TARGET GENE. LOC285366 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285366, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285366 BINDING SITE, designated SEQ ID:1542, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17391] Another function of GAM99 is therefore inhibition of LOC285366 (Accession XP_209581.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285366.

[17392] LOC285388 (Accession XP_208316.1) is another GAM99 target gene, herein designated TARGET GENE. LOC285388

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285388, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285388 BINDING SITE, designated SEQ ID:19495, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17393] Another function of GAM99 is therefore inhibition of LOC285388 (Accession XP_208316.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285388.

[17394] LOC286101 (Accession XP_209902.1) is another GAM99 target gene, herein designated TARGET GENE. LOC286101 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286101, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286101 BINDING SITE, designated SEQ ID:16310, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17395] Another function of GAM99 is therefore inhibition of LOC286101 (Accession XP_209902.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286101.

[17396] LOC286184 (Accession XP_212216.1) is another GAM99 target gene, herein designated TARGET GENE. LOC286184 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286184, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286184 BINDING SITE, designated SEQ ID:15285, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17397] Another function of GAM99 is therefore inhibition of LOC286184 (Accession XP_212216.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286184.

[17398] LOC286188 (Accession XP_209933.1) is another GAM99 target gene, herein designated TARGET GENE. LOC286188 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC286188, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286188 BINDING SITE, designated SEQ ID:2050, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17399] Another function of GAM99 is therefore inhibition of LOC286188 (Accession XP_209933.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286188.

[17400] LOC339199 (Accession XP_290759.1) is another GAM99 target gene, herein designated TARGET GENE. LOC339199 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339199, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339199 BINDING SITE, designated SEQ ID:20117, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17401] Another function of GAM99 is therefore inhibition of

LOC339199 (Accession XP_290759.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339199.

[17402] LOC340371 (Accession XP_291255.2) is another GAM99 target gene, herein designated TARGET GENE. LOC340371 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC340371, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340371 BINDING SITE, designated SEQ ID:6677, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17403] Another function of GAM99 is therefore inhibition of LOC340371 (Accession XP_291255.2) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340371.

[17404] LOC340371 (Accession NP_848659.1) is another GAM99 target gene, herein designated TARGET GENE. LOC340371 BINDING SITE is a target binding site found in the 3` un-

translated region of multiple transcripts of mRNA encoded by LOC340371, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340371 BINDING SITE, designated SEQ ID:6677, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17405] Another function of GAM99 is therefore inhibition of LOC340371 (Accession NP_848659.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340371.

[17406] LOC342346 (Accession XP_296817.2) is another GAM99 target gene, herein designated TARGET GENE. LOC342346 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC342346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC342346 BINDING SITE, designated SEQ ID:6898, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17407] Another function of GAM99 is therefore inhibition of LOC342346 (Accession XP_296817.2) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC342346.

[17408] LOC346284 (Accession XP_294161.2) is another GAM99 target gene, herein designated TARGET GENE. LOC346284 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC346284, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC346284 BINDING SITE, designated SEQ ID:18310, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17409] Another function of GAM99 is therefore inhibition of LOC346284 (Accession XP_294161.2) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC346284.

[17410] LOC349228 (Accession XP_303005.1) is another GAM99 target gene, herein designated TARGET GENE. LOC349228 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC349228, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349228 BINDING SITE, designated SEQ ID:8523, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17411] Another function of GAM99 is therefore inhibition of LOC349228 (Accession XP_303005.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349228.

[17412] LOC349282 (Accession XP_301008.1) is another GAM99 target gene, herein designated TARGET GENE. LOC349282 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349282, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349282 BINDING SITE, designated SEQ ID:4792, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17413] Another function of GAM99 is therefore inhibition of

LOC349282 (Accession XP_301008.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349282.

[17414] LOC349313 (Accession XP_301024.1) is another GAM99 target gene, herein designated TARGET GENE. LOC349313 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349313, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349313 BINDING SITE, designated SEQ ID:4792, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17415] Another function of GAM99 is therefore inhibition of LOC349313 (Accession XP_301024.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349313.

[17416] LOC57209 (Accession XP_290488.1) is another GAM99 target gene, herein designated TARGET GENE. LOC57209 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC57209, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC57209 BINDING SITE, designated SEQ ID:2672, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17417] Another function of GAM99 is therefore inhibition of LOC57209 (Accession XP_290488.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57209.

[17418] LOC63920 (Accession NP_071373.2) is another GAM99 target gene, herein designated TARGET GENE. LOC63920 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC63920, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC63920 BINDING SITE, designated SEQ ID:6406, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17419] Another function of GAM99 is therefore inhibition of LOC63920 (Accession NP_071373.2) . Accordingly, utili-

ties of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC63920.

[17420] LOC94468 (Accession XP_017293.3) is another GAM99 target gene, herein designated TARGET GENE. LOC94468 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC94468, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC94468 BINDING SITE, designated SEQ ID:1169, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17421] Another function of GAM99 is therefore inhibition of LOC94468 (Accession XP_017293.3) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC94468.

[17422] Leupaxin (LPXN, Accession NP_004802.1) is another GAM99 target gene, herein designated TARGET GENE. LPXN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LPXN, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LPXN BINDING SITE, designated SEQ ID:9179, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17423] Another function of GAM99 is therefore inhibition of Leupaxin (LPXN, Accession NP_004802.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPXN.

[17424] Melanoma antigen, family a, 4 (MAGEA4, Accession NP_002353.2) is another GAM99 target gene, herein designated TARGET GENE. MAGEA4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAGEA4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAGEA4 BINDING SITE, designated SEQ ID:6081, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17425] Another function of GAM99 is therefore inhibition of Melanoma antigen, family a, 4 (MAGEA4, Accession

NP_002353.2), a gene which may play a role in embryonal development and tumor transformation or tumor progression and therefore may be associated with Hodgkin disease. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Hodgkin disease, and of other diseases and clinical conditions associated with MAGEA4.

[17426] The function of MAGEA4 has been established by previous studies. Genes of the MAGE- A family are expressed in several types of solid tumors but are silent in normal tissues, with the exception of male germline cells, which do not carry HLA molecules. Therefore, peptides encoded by MAGE- A genes are strictly tumor- specific antigens that can be recognized by CTL and constitute promising targets for immunotherapy. Chambost et al. (2000) found that 5 of 18 samples (28%) from patients with Hodgkin disease expressed MAGE- A4. In tissue sections, staining by a monoclonal antibody that recognizes MAGE- A4 protein was observed in 11 of 53 samples (21%) from patients with Hodgkin disease. In the positive samples, the Reed-Sternberg cells were strongly stained, whereas the surrounding cells were not. These results indicated that Hodgkin disease may be a target for specific immunother-

apy involving MAGE- A4 antigens. De Plaen et al. (1994) used human/rodent cell hybrids to map the MAGE family A cluster to Xq26- qter. Rogner et al. (1995) refined the mapping of the MAGE family A cluster to Xq28. The 12 genes are arranged in 3 clusters within 3.5 Mb.

[17427]

[17428] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17429] Chambost, H.; Van Baren, N.; Brasseur, F.; Godelaine, D.; Xerri, L.; Landi, S. J.; Theate, I.; Plumas, J.; Spagnoli, G. C.; Michel, G.; Coulie, P. G.; Olive, D. : Expression of gene MAGE- A4 in Reed- Sternberg cells. Blood 95: 3530-3533, 2000. ; and

[17430] De Plaen, E.; Arden, K.; Traversari, C.; Gaforio, J. J.; Szikora, J.- P.; De Smet, C.; Brasseur, F.; van der Bruggen, P.; Lethe, B.; Lurquin, C.; Brasseur, R.; Chomez, P.; De Backer, O.;.

[17431] Further studies establishing the function and utilities of MAGEA4 are found in John Hopkins OMIM database record ID 300175, and in cited publications listed in Table 5, which are hereby incorporated by refer-ence.Mitogen-activated protein kinase kinase 1 (MAP2K1,

Accession NP_002746.1) is another GAM99 target gene, herein designated TARGET GENE. MAP2K1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAP2K1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP2K1 BINDING SITE, designated SEQ ID:20080, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17432] Another function of GAM99 is therefore inhibition of Mitogen-activated protein kinase kinase 1 (MAP2K1, Accession NP_002746.1), a gene which is a signaling intermediate, may take part in cell transformation and therefore may be associated with Colon cancer. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Colon cancer, and of other diseases and clinical conditions associated with MAP2K1.

[17433] The function of MAP2K1 has been established by previous studies. Mitogen- activated protein (MAP) kinases, also known as extracellular signal- regulated kinases (ERKs) (see OMIM Ref. No. PRKM1; 176948), are thought to act as an integration point for multiple biochemical signals be-

cause they are activated by a wide variety of extracellular signals, are rapidly phosphorylated on threonine and tyrosine residues, and are highly conserved in evolution (Crews et al., 1992). A critical protein kinase lies upstream of MAP kinase and stimulates the enzymatic activity of MAP kinase. Crews et al. (1992) cloned a mouse cDNA, denoted Mek1 (for Map/Erk kinase- 1) by them, that encodes a member of this protein kinase family. The 393-amino acid, 43.5- kD protein is most closely related in size and sequence to the product encoded by the byr1 gene of S. pombe. Crews et al. (1992) found that Mek1 protein expressed in bacteria phosphorylates the Erk gene product in vitro. They showed that the Mek1 gene is highly expressed in murine brain. Ryan et al. (2000) showed that inhibition of MEK1 blocks p53 (OMIM Ref. No. 191170)- induced NF- kappa- B activation and apoptosis but not cell cycle arrest. They demonstrated that p53 activates NF- kappa- B through the RAF/MEK1/p90(rsk) (see OMIM Ref. No. 601684) pathway rather than the TNFR1 (OMIM Ref. No. 191190)/TRAF2 (OMIM Ref. No. 601895)/IKK (e.g., 600664) pathway used by TNFA (OMIM Ref. No. 191160). To elucidate the mechanism through which MAPK signaling regulates the MYOD (OMIM Ref. No.

159970) family of transcription factors, Perry et al. (2001) investigated the role of the signaling intermediate MEK1 in myogenesis. Transfection of activated MEK1 strongly repressed gene activation and myogenic conversion by the MYOD family. This repression was not mediated by direct phosphorylation of MYOD or by changes in MYOD stability or subcellular distribution. Deletion mapping revealed that MEK1- mediated repression required the MYOD N- terminal transactivation domain. Moreover, activated MEK1 was nuclearly localized and bound a complex containing MYOD in a manner that was dependent on the presence of the MYOD N terminus. These data demonstrated that MEK1 signaling has a strong negative effect on MYOD activity via a mechanism involving binding of MEK1 to the nuclear MYOD transcriptional comple

[17434]

[17435] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17436] Crews, C. M.; Alessandrini, A.; Erikson, R. L. : The primary structure of MEK, a protein kinase that phosphorylates the ERK gene product. Science 258: 478- 480, 1992. ; and

[17437] Perry, R. L. S.; Parker, M. H.; Rudnicki, M. A. : Activated

MEK1 binds the nuclear MyoD transcriptional complex to repress transactivation. Molec. Cell 8: 291- 301, 2001.

[17438] Further studies establishing the function and utilities of MAP2K1 are found in John Hopkins OMIM database record ID 176872, and in cited publications listed in Table 5, which are hereby incorporated by reference.MGC14141 (Accession NP_116317.1) is another GAM99 target gene, herein designated TARGET GENE. MGC14141 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC14141, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC14141 BINDING SITE, designated SEQ ID:3511, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17439] Another function of GAM99 is therefore inhibition of MGC14141 (Accession NP_116317.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14141.

[17440] MGC34648 (Accession NP_689873.1) is another GAM99 target gene, herein designated TARGET GENE. MGC34648

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC34648, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC34648 BINDING SITE, designated SEQ ID:5090, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17441] Another function of GAM99 is therefore inhibition of MGC34648 (Accession NP_689873.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC34648.

[17442] MGC4189 (Accession NP_115684.1) is another GAM99 target gene, herein designated TARGET GENE. MGC4189 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4189, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4189 BINDING SITE, designated SEQ ID:9209, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17443] Another function of GAM99 is therefore inhibition of MGC4189 (Accession NP_115684.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4189.

[17444] Myeloid/lymphoid or mixed-lineage leukemia (trithorax homolog, drosophila); translocated to, 2 (MLLT2, Accession NP_005926.1) is another GAM99 target gene, herein designated TARGET GENE. MLLT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MLLT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MLLT2 BINDING SITE, designated SEQ ID:6110, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17445] Another function of GAM99 is therefore inhibition of Myeloid/lymphoid or mixed-lineage leukemia (trithorax homolog, drosophila); translocated to, 2 (MLLT2, Accession NP_005926.1), a gene which is a Putative transcription factor. and therefore is associated with Acute leukemias. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Acute leukemias, and of other diseases and clinical conditions associated with

MLLT2.

[17446] The function of MLLT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM96.1.2'-5'-oligoadenylate synthetase 2, 69/71kda (OAS2, Accession NP_002526.1) is another GAM99 target gene, herein designated TARGET GENE. OAS2 BINDING SITE1 and OAS2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by OAS2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OAS2 BINDING SITE1 and OAS2 BINDING SITE2, designated SEQ ID:4904 and SEQ ID:18197 respectively, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17447] Another function of GAM99 is therefore inhibition of 2'-5'-oligoadenylate synthetase 2, 69/71kda (OAS2, Accession NP_002526.1), a gene which may play a role in mediating resistance to virus infection, control of cell growth, differentiation, and apoptosis. Accordingly, utilities of GAM99 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with OAS2.

[17448] The function of OAS2 has been established by previous studies. The 2- prime,5- prime oligoadenylate synthetases (OASs) are interferon- induced proteins characterized by their capacity to catalyze the synthesis of 2- prime,5- prime oligomers of adenosine (2- 5As). See OAS1 (OMIM Ref. No. 164350). Hovanessian et al. (1987) found that interferon- treated human cells contain several OASs corresponding to proteins of 40 (OAS1), 46 (OAS1), 69, and 100 (OMIM Ref. No. 603351) kD. Marie et al. (1989) generated highly specific polyclonal antibodies against p69, the 69- kD OAS. By screening an interferon-treated human cell expression library with the anti- p69 antibodies, Marie and Hovanessian (1992) isolated a partial OAS2 cDNA. They screened additional libraries with the partial cDNA and recovered cDNAs encoding 2 OAS2 isoforms. The smaller isoform is encoded by 2 mRNAs that differ in the length of the 3- prime untranslated region. Northern blot analysis revealed that OAS2 is expressed as 4 interferon- induced mRNAs in human cells. The predicted OAS2 proteins have a common 683- amino acid sequence and different 3- prime termini. By SDS-

PAGE of in vitro transcription/translation products, the authors showed that 2 isoforms have molecular masses of 69 and 71 kD. Both isoforms exhibited OAS activity in vitro. Sequence analysis indicated that OAS2 contains 2 OAS1- homologous domains separated by a proline- rich putative linker region. The N- and C- terminal domains are 41% and 53% identical to OAS1, respectively. Marie and Hovanessian (1992) suggested that the OAS2 gene derived from the fusion of 2 ancestral genes analogous to OAS1. By fluorescence in situ hybridization and by inclusion within mapped clones, Hovnanian et al. (1998) determined that the OAS1, OAS2, and OAS3 genes are clustered with a 130- kb region on 12q24.2.

[17449]

[17450] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17451] Hovnanian, A.; Rebouillat, D.; Mattei, M.- G.; Levy, E. R.; Marie, I.; Monaco, A. P.; Hovanessian, A. G. : The human 2- prime,5- prime- oligoadenylate synthetase locus is composed of three distinct genes clustered on chromosome 12q24.2 encoding the 100-, 69-, and 40- kDa forms. Genomics 52: 267- 277, 1998. ; and

[17452] Marie, I.; Hovanessian, A. G. : The 69- kDa 2- 5A synthetase is composed of two homologous and adjacent functional domains. J. Biol. Chem. 267: 9933- 9939, 1992.

[17453] Further studies establishing the function and utilities of OAS2 are found in John Hopkins OMIM database record ID 603350, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein phosphatase 2, regulatory subunit b (b56), gamma isoform (PPP2R5C, Accession NP_848701.1) is another GAM99 target gene, herein designated TARGET GENE. PPP2R5C BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PPP2R5C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP2R5C BINDING SITE, designated SEQ ID:9224, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17454] Another function of GAM99 is therefore inhibition of Protein phosphatase 2, regulatory subunit b (b56), gamma isoform (PPP2R5C, Accession NP_848701.1), a gene which is a regulatory subunit of protein phosphatase 2A. Ac-

cordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5C.

[17455] The function of PPP2R5C has been established by previous studies. Protein phosphorylation is a regulatory mechanism commonly employed in cellular processes such as cell cycle progression, growth factor signaling, and cell transformation. Protein phosphatase 2A (PP2A), a heterotrimeric serine/threonine phosphatase, has been implicated in a variety of regulatory processes including cell growth and division, muscle contraction, and gene transcription. PP2A is a trimeric enzyme composed of a catalytic subunit (OMIM Ref. No. 176915), a structural subunit, and any of several different regulatory subunits which control its specificity. One family of related PP2A regulatory subunits is designated the B56 family and contains at least 5 different members (McCright and Virshup (1995)). The alpha (OMIM Ref. No. 601643) and gamma subunits are expressed at highest levels in skeletal and cardiac muscle. Both the delta (OMIM Ref. No. 601646) and gamma subunits encode nuclear phosphoproteins and at least 3 splice variants of the gamma subunit have been reported. The longest gamma isoform is a phospho-

protein, but the shortest is not.

[17456]

[17457] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17458] McCright, B.; Brothman, A. R.; Virshup, D. M. : Assignment of human protein phosphatase 2A regulatory subunit genes B56- alpha, B56- beta, B56- gamma, B56- delta, and B56- epsilon (PPP2R5A- - PPP2R5E), highly expressed in muscle and brain, to chromosome regions 1q41, 11q12, 3p21, 6p21.1, and 7p11.2- to- p12. [17459] McCright, B.; Virshup, D. M. : Identification of a new family of protein phosphatase 2A regulatory subunits. J. Biol. Chem. 270: 26123- 26128, 1995.

[17460] Further studies establishing the function and utilities of PPP2R5C are found in John Hopkins OMIM database record ID 601645, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein phosphatase 2, regulatory subunit b (b56), gamma isoform (PPP2R5C, Accession NP_002710.2) is another GAM99 target gene, herein designated TARGET GENE. PPP2R5C BINDING SITE is a target binding site found in the 3` un-

translated region of multiple transcripts of mRNA encoded by PPP2R5C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP2R5C BINDING SITE, designated SEQ ID:9224, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17461] Another function of GAM99 is therefore inhibition of Protein phosphatase 2, regulatory subunit b (b56), gamma isoform (PPP2R5C, Accession NP_002710.2), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5C.

[17462] The function of PPP2R5C has been established by previous studies. Protein phosphorylation is a regulatory mechanism commonly employed in cellular processes such as cell cycle progression, growth factor signaling, and cell transformation. Protein phosphatase 2A (PP2A), a heterotrimeric serine/threonine phosphatase, has been implicated in a variety of regulatory processes including cell growth and division, muscle contraction, and gene transcription. PP2A is a trimeric enzyme composed of a cat-

alytic subunit (OMIM Ref. No. 176915), a structural subunit, and any of several different regulatory subunits which control its specificity. One family of related PP2A regulatory subunits is designated the B56 family and contains at least 5 different members (McCright and Virshup (1995)). The alpha (OMIM Ref. No. 601643) and gamma subunits are expressed at highest levels in skeletal and cardiac muscle. Both the delta (OMIM Ref. No. 601646) and gamma subunits encode nuclear phosphoproteins and at least 3 splice variants of the gamma subunit have been reported. The longest gamma isoform is a phosphoprotein, but the shortest is not.

[17463]

[17464] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17465] McCright, B.; Brothman, A. R.; Virshup, D. M. : Assignment of human protein phosphatase 2A regulatory subunit genes B56- alpha, B56- beta, B56- gamma, B56- delta, and B56- epsilon (PPP2R5A- - PPP2R5E), highly expressed in muscle and brain, to chromosome regions 1q41, 11q12, 3p21, 6p21.1, and 7p11.2- to- p12. Genomics 36: 168- 170, 1996. ; and

[17466] McCright, B.; Virshup, D. M. : Identification of a new family of protein phosphatase 2A regulatory subunits. J. Biol. Chem. 270: 26123- 26128, 1995.

[17467] Further studies establishing the function and utilities of PPP2R5C are found in John Hopkins OMIM database record ID 601645, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein kinase c, beta 1 (PRKCB1, Accession NP_002729.2) is another GAM99 target gene, herein designated TARGET GENE. PRKCB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKCB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKCB1 BINDING SITE, designated SEQ ID:10260, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17468] Another function of GAM99 is therefore inhibition of Protein kinase c, beta 1 (PRKCB1, Accession NP_002729.2), a gene which is a calcium- activated, phospholipid- dependent, serine- and threonine- specific enzyme. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with PRKCB1.

[17469] The function of PRKCB1 has been established by previous studies. Greenham et al. (1998) determined the genomic structure of the PRKCB gene. The PRKCB gene consists of 18 exons spanning 375 kb, with a particularly large intron of over 150 kb between exons 2 and 3. Exons range from 32 to 174 bp in length. Francke et al. (1989) stated that the most likely location of PKCB is 16p11.2.

[17470] Animal model experiments lend further support to the function of PRKCB1. Leitges et al. (1996) found that mice homozygous for a targeted disruption of the Prkcb1 gene develop an immunodeficiency characterized by impaired humoral immune responses and reduced cellular responses of B cells similar to X- linked immunodeficiency (Xid) in mice (see OMIM Ref. No. 300300). Thus, they concluded that the 2 isoforms, PKC- beta- I (OMIM Ref. No. PRKCB1) and PKC- beta- II (OMIM Ref. No. PRKCB2), play an important role in B- cell activation and may be functionally linked to Bruton tyrosine kinase (OMIM Ref. No. 300300) in antigen receptor- mediated signal transduction. Su et al. (2002) showed that mice lacking Prkcb are unable to activate Nfkb (OMIM Ref. No. 164011) and promote cell survival in B cells upon BCR signaling, or even in

mast cells which, unlike B cells, also express Prkcq (OMIM Ref. No. 600448). The failure to activate Nfkb is associated with a lack of Ikba (OMIM Ref. No. 164008) degradation as well as an absence of Ikka (OMIM Ref. No. 600664) phosphorylation activity. Prkcb - /- mice, lacking the Prkcb enzyme in lipid rafts after BCR stimulation, are also unable to recruit Ikka and Ikkb (OMIM Ref. No. 603258) to the rafts in B cells and have a reduced capacity to recruit other members of the BCR signalosome. However, Prkcb-deficient mice, unlike Xid mice, do have mature B cells expressing IgM and IgD, suggesting that the cells are maintained by an alternative Nfkb- activating pathway, e.g., through CD40 (OMIM Ref. No. 109535). Su et al. (2002) observed that specific Prkcb small molecule inhibitors block the survival of non- Hodgkin diffuse large B cell lymphoma (DLBCL) cell lines, with the effective dose depending on the level of cellular Prkcb. DLBCL lines not expressing Prkcb were not susceptible to the inhibitors. Su et al. (2002) proposed that PRKCB inhibitors and inhibitors of other PRKC isoforms may be effective in treating disorders characterized by dysregulated NFKB survival signaling.

[17471] It is appreciated that the abovementioned animal model

for PRKCB1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17472] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17473] Leitges, M.; Schmedt, C.; Guinamard, R.; Davoust, J.; Schaal, S.; Stabel, S.; Tarakhovsky, A. : Immunodeficiency in protein kinase C- beta- deficient mice. Science 273: 788- 791, 1996. ; and

[17474] Su, T. T.; Guo, B.; Kawakami, Y.; Sommer, K.; Chae, K.; Humphries, L. A.; Kato, R. M.; Kang, S.; Patrone, L.; Wall, R.; Teitell, M.; Leitges, M.; Kawakami, T.; Rawlings, D. J. : PKC- beta.

[17475] Further studies establishing the function and utilities of PRKCB1 are found in John Hopkins OMIM database record ID 176970, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein kinase c, nu (PRKCN, Accession NP_005804.1) is another GAM99 target gene, herein designated TARGET GENE. PRKCN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKCN, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKCN BINDING SITE, designated SEQ ID:11840, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17476] Another function of GAM99 is therefore inhibition of Protein kinase c, nu (PRKCN, Accession NP_005804.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCN.

[17477] Prp4 pre-mrna processing factor 4 homolog (yeast) (PRPF4, Accession NP_004688.2) is another GAM99 target gene, herein designated TARGET GENE. PRPF4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRPF4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRPF4 BINDING SITE, designated SEQ ID:6260, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17478] Another function of GAM99 is therefore inhibition of Prp4 pre-mrna processing factor 4 homolog (yeast) (PRPF4, Ac-

cession NP_004688.2) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF4.

[17479] Pregnancy specific beta-1-glycoprotein 1 (PSG1, Accession NP_008836.2) is another GAM99 target gene, herein designated TARGET GENE. PSG1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PSG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSG1 BINDING SITE, designated SEQ ID:3147, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17480] Another function of GAM99 is therefore inhibition of Pregnancy specific beta-1-glycoprotein 1 (PSG1, Accession NP_008836.2), a gene which is a member of the pregnancy- specific glycoprotein (PSG) and CEA families. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSG1.

[17481] The function of PSG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM94.1.Pregnancy specific beta-1-glycoprotein 4 (PSG4, Accession NP_002771.1) is another GAM99 target gene, herein designated TARGET GENE. PSG4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PSG4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSG4 BINDING SITE, designated SEQ ID:4422, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17482] Another function of GAM99 is therefore inhibition of Pregnancy specific beta-1-glycoprotein 4 (PSG4, Accession NP_002771.1), a gene which is a member of the pregnancy- specific glycoprotein (PSG) and CEA families. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSG4.

[17483] The function of PSG4 has been established by previous studies. The human pregnancy- specific glycoproteins (PSGs) are a group of molecules that are mainly produced by the placental syncytiotrophoblasts during pregnancy. PSGs comprise a subgroup of the carcinoembryonic anti-

gen (CEA) family, which belongs to the immunoglobulin superfamily. See PSG3 (OMIM Ref. No. 176392) for additional information about PSGs. Teglund et al. (1994) found that the PSG4 gene contains 6 exons. They noted that PSG9, which had been thought to be a novel gene, is in fact an allelic variant of PSG4 that differs by 6 bp in the coding region. (The OMIM Ref. No. 176398.) Studies by several groups resulted in the mapping of the CEA gene family to 19q13.1- q13.2 (Thompson et al., 1990; Thompson et al., 1992; Tynan et al., 1992; Trask et al., 1993). The PSG subgroup is located telomeric of the CEA subgroup, and together they span approximately 1.1 to 1.2 Mb (Brandriff et al., 1992; Tynan et al., 1992). Using a high- resolution restriction fragment fingerprinting technique, Olsen et al. (1994) assembled 256 cosmids spanning the PSG region on 19q13.2 into a single 700- kb contig. FISH to sperm pronuclei and cosmid walking experiments indicated that this PSG contig is telomeric of CGM8 at the telomeric end of the CEA subgroup gene cluster. Detailed restriction mapping and hybridization with gene- specific probes indicated that the order of the 11 PSG genes in the contig is cen- - PSG3- - PSG8 (OMIM Ref. No. 176397)- - PSG12 (PSG10; 176399)- - PSG1

(OMIM Ref. No. 176390)- - PSG6 (OMIM Ref. No. 176395)- - PSG7 (OMIM Ref. No. 176396)- - PSG13 (PSG11; 176401)- - PSG2 (OMIM Ref. No. 176391)- - PSG5 (OMIM Ref. No. 176394)- - PSG4- - PSG11 (PSG9; 176398)- - tel. The PSG genes are tandemly oriented in a 5- prime to 3- prime direction from telomere to centromere. The CEA subgroup gene CGM11 is located at the telomeric end of the PSG gene cluster, and 6 genes belonging to a third CEA family subgroup, namely CGM13 through CGM18 (later OMIM Ref. No. 109770), are interspersed among the PSG genes. Nomenclature: Beauchemin et al. (1999) provided a revised nomenclature for the CEA gene family. Based on this nomenclature, the CEA family is composed of the PSG subfamily, the CEACAM subfamily (see OMIM Ref. No. 109770), and the CEACAM pseudogene (CEACAMP) subfamily (see OMIM Ref. No. 109770). PSG11, PSG12, and PSG13 were renamed PSG9, PSG10, and PSG11, respectively

[17484]

[17485] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17486] Beauchemin, N.; Draber, P.; Dveksler, G.; Gold, P.; Gray-

Owen, S.; Grunert, F.; Hammarstrom, S.; Holmes, K. V.; Karlsson, A.; Kuroki, M.; Lin, S.- H.; Lucka, L.; and 13 others : Redefined nomenclature for members of the carcinoembryonic antigen family. Exp. Cell Res. 252: 243-249, 1999. ; and

[17487] Brandriff, B. F.; Gordon, L. A.; Tynan, K. T.; Olsen, A. S.; Mohrenweiser, H. W.; Fertitta, A.; Carrano, A. V.; Trask, B. J. : Order and genomic distances among members of the carcinoem.

[17488] Further studies establishing the function and utilities of PSG4 are found in John Hopkins OMIM database record ID 176393, and in cited publications listed in Table 5, which are hereby incorporated by reference.Phosphotriesterase related (PTER, Accession NP_109589.2) is another GAM99 target gene, herein designated TARGET GENE. PTER BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTER, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTER BINDING SITE, designated SEQ ID:10176, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17489] Another function of GAM99 is therefore inhibition of Phosphotriesterase related (PTER, Accession NP_109589.2), a gene which is a phosphotriesterase homology protein. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTER.

[17490] The function of PTER and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.1.Rab7, member ras oncogene family-like 1 (RAB7L1, Accession NP_003920.1) is another GAM99 target gene, herein designated TARGET GENE. RAB7L1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB7L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB7L1 BINDING SITE, designated SEQ ID:6897, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17491] Another function of GAM99 is therefore inhibition of Rab7, member ras oncogene family-like 1 (RAB7L1, Accession NP_003920.1) . Accordingly, utilities of GAM99

include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB7L1.

[17492] Ring finger protein (c3hc4 type) 8 (RNF8, Accession NP_003949.1) is another GAM99 target gene, herein designated TARGET GENE. RNF8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNF8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF8 BINDING SITE, designated SEQ ID:17319, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17493] Another function of GAM99 is therefore inhibition of Ring finger protein (c3hc4 type) 8 (RNF8, Accession NP_003949.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF8.

[17494] Secreted frizzled-related protein 4 (SFRP4, Accession NP_003005.1) is another GAM99 target gene, herein designated TARGET GENE. SFRP4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SFRP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFRP4 BINDING SITE, designated SEQ ID:19985, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17495] Another function of GAM99 is therefore inhibition of Secreted frizzled-related protein 4 (SFRP4, Accession NP_003005.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP4.

[17496] Solute carrier family 25 (mitochondrial carrier; ornithine transporter) member 15 (SLC25A15, Accession NP_055067.1) is another GAM99 target gene, herein designated TARGET GENE. SLC25A15 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC25A15, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC25A15 BINDING SITE, designated SEQ ID:1242, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17497] Another function of GAM99 is therefore inhibition of Solute carrier family 25 (mitochondrial carrier; ornithine

transporter) member 15 (SLC25A15, Accession NP_055067.1), a gene which participates theornithine transport across inner mitochondrial membrane, from the cytoplasm to the matrix and therefore is associated with Hyperornithinemia- hyperammonemia- homocitrullinuria syndrome (hhh syndrome). Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Hyperor- nithinemia- hyperammonemia- homocitrullinuria syn- drome (hhh syndrome), and of other diseases and clinical conditions associated with SLC25A15.

[17498] The function of SLC25A15 has been established by previ- ous studies. The urea cycle is an example of metabolic homeostasis, maintaining concentrations of a toxic metabolite, ammonium ions, in a narrow, tolerable range despite more than 10- fold variations in dietary intake of its precursor, nitrogen. Five enzymes in 2 subcellular compartments (mitochondrial matrix and cytosol) accom- plish this feat. Another vital component of the urea cycle is the transporter required to move ornithine across the inner mitochondrial membrane from cytosol to mitochon- drial matrix. This is the transporter that is defective in hy- perornithinemia- hyperammonemia- homocitrullinuria (HHH syndrome; 238970 Neurospora crassa ARG13 and

Saccharomyces cerevisiae ARG11 encode mitochondrial carrier family proteins that transport ornithine across the mitochondrial inner membrane. Camacho et al. (1999) used their sequences to identify EST candidates derived from genes that encode orthologous mammalian transporters. They thereby identified a gene, ORNT1, that maps to 13q14 and whose expression, similar to that of other urea cycle components, was high in liver and varied with changes in dietary protein. ORNT1 expression restored ornithine metabolism in fibroblasts from patients with HHH syndrome. They found that the ORNT1 gene encodes a 301- residue protein with 95% identity to mouse Ornt1 and 28% identity to Neurospora ARG13. Expression of either murine or human ORNT1 restored normal ornithine metabolism in HHH fibroblasts. The protein localized to mitochondria. In a survey of 11 HHH probands, Camacho et al. (1999) identified 3 ORNT1 mutant alleles that accounted for 21 of 22 possible mutant ORNT1 genes in these patients

[17499]

[17500] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17501] Camacho, J. A.; Obie, C.; Biery, B.; Goodman, B. K.; Hu, C.-A.; Almashanu, S.; Steel, G.; Casey, R.; Lambert, M.; Mitchell, G. A.; Valle, D. : Hyperornithinaemia- hyperammonaemia- homocitrullinuria syndrome is caused by mutations in a gene encoding a mitochondrial ornithine transporter. Nature Genet. 22: 151- 158, 1999. ; and

[17502] Tsujino, S.; Kanazawa, N.; Ohashi, T.; Eto, Y.; Saito, T.; Kira, J.; Yamada, T. : Three novel mutations (G27E, insAAC, R179X) in the ORNT1 gene of Japanese patients with hyperornithinemia.

[17503] Further studies establishing the function and utilities of SLC25A15 are found in John Hopkins OMIM database record ID 603861, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 2 (facilitated glucose/fructose transporter), member 5 (SLC2A5, Accession NP_003030.1) is another GAM99 target gene, herein designated TARGET GENE. SLC2A5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC2A5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC2A5 BINDING SITE, designated SEQ ID:5294, to the

nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17504] Another function of GAM99 is therefore inhibition of Solute carrier family 2 (facilitated glucose/fructose transporter), member 5 (SLC2A5, Accession NP_003030.1), a gene which has probable role as a fructose transporter. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A5.

[17505] The function of SLC2A5 has been established by previous studies. Davidson et al. (1992) showed that the glucose transporter isoform, GLUT5, is expressed on the brush border membrane of human small intestinal enterocytes. Burant et al. (1992) showed further that GLUT5 is a fructose transporter and may be largely responsible for the uptake of fructose from the lumen of the small intestine. GLUT2, which is present on the basolateral membrane of enterocytes, probably mediates the efflux of fructose from these cells. In addition, GLUT5 is probably responsible for the uptake of fructose by spermatozoa. The pattern of GLUT5 immunoreactivity in maturing spermatids suggested that the expression of GLUT5 may serve as a marker for terminal maturation of male germ cells. An in-

creasing fraction of calories consumed in Western diets is derived from fructose. Increases in fructose consumption have been implicated in a rising incidence of hypertriglyceridemia and hyperinsulinemia. Mutations in the small intestinal sodium/glucose cotransporter (OMIM Ref. No. 182380), which effectively abolish glucose uptake, have no effect on the absorption of fructose, indicating a separate fructose carrier protein. Using cDNA probes for Southern blotting of DNA from somatic cell hybrids and for in situ hybridization, Fan et al. (1989) showed that the GLUT5 gene (also symbolized SLC2A5) is located on chromosome 1. Also see Kayano et al. (1990). White et al. (1998) concluded that the correct assignment of SLC2A5 is 1p36.2. This was confirmed by use of somatic cell and radiation hybrid mapping panels and was consistent with previous EST mapping data. The carbonic anhydrase- 6 (CA6; 114780) and alpha- enolase (ENO1; 172430) genes were physically linked to SLCA5 in yeast- and P1- artificial chromosome (YAC and PAC) contigs. PACs from the contig were mapped to 1p36.2 by fluorescence in situ hybridization.

[17506]

[17507] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[17508] Davidson, N. O.; Hausman, A. M. L.; Ifkovits, C. A.; Buse, J. B.; Gould, G. W.; Burant, C. F.; Bell, G. I. : Human intestinal glucose transporter expression and localization of GLUT5. Am. J. Physiol. 262: C795- C800, 1992. ; and

[17509] White, P. S.; Jensen, S. J.; Rajalingam, V.; Stairs, D.; Sulman, E. P.; Maris, J. M.; Biegel, J. A.; Wooster, R.; Brodeur, G. M. : Physical mapping of the CA6, ENO1, and SLC2A5 (GLUT5) gene.

[17510] Further studies establishing the function and utilities of SLC2A5 are found in John Hopkins OMIM database record ID 138230, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sorbin and sh3 domain containing 1 (SORBS1, Accession NP_056200.1) is another GAM99 target gene, herein designated TARGET GENE. SORBS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SORBS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SORBS1 BINDING SITE, designated SEQ ID:5727, to the nucleotide sequence of GAM99

RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17511] Another function of GAM99 is therefore inhibition of Sorbin and sh3 domain containing 1 (SORBS1, Accession NP_056200.1), a gene which necessary for cell polarization during vegetative growth and therefore may be associated with Obesity and type 2 diabetes. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Obesity and type 2 diabetes, and of other diseases and clinical conditions associated with SORBS1.

[17512] The function of SORBS1 has been established by previous studies. Lin et al. (2001) identified 14 single- nucleotide polymorphisms (SNPs) in the human SH3P12 gene, which they called SORBS1. Studies in 202 nonobese, 113 obese, and 455 subjects with type II diabetes (OMIM Ref. No. 125853) revealed that the alanine allele of a T228A polymorphism in exon 7 exerted a protective role for both obesity (OMIM Ref. No. 601665) (relative risk 0.466; 95% confidence interval 0.265 to 0.821) and diabetes (relative risk 0.668; 95% confidence interval 0.472 to 0.945). Neither allele of the R74W polymorphism was associated with either obesity or diabetes. The authors suggested that the SH3P12 gene may play an important role in the pathogen-

esis of human disorders with insulin resistance. Insulin stimulates the transport of glucose into fat and muscle cells and initiates its actions by binding to its tyrosine kinase receptor, leading to the phosphorylation of intracellular substrates. One such substrate is the CBL protooncogene product. CBL is recruited to the insulin receptor by interaction with the adaptor protein CAP, through 1 of 3 adjacent SH3 domains in the C terminus of CAP. Upon phosphorylation of CBL, the CAP- CBL complex dissociates from the insulin receptor and moves to a caveolin (see OMIM Ref. No. 601047)- enriched triton- insoluble membrane fraction (Mastick et al., 1995). To identify a molecular mechanism underlying this subcellular redistribution, Baumann et al. (2000) screened a yeast 2- hybrid library using the N- terminal region of CAP and identified the caveolar protein flotillin (OMIM Ref. No. 131560). Flotillin forms a ternary complex with CAP and CBL, directing the localization of the CAP- CBL complex to a lipid raft subdomain of the plasma membrane. Expression of the N- terminal domain of CAP in 3T3- L1 adipocytes blocks the stimulation of glucose transport by insulin, without affecting signaling events that depend on phosphatidylinositol- 3- OH kinase (see OMIM Ref. No.

602838). Thus, localization of the CBL- CAP complex to lipid rafts generates a pathway that is crucial in the regulation of glucose uptake.

[17513]

[17514] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17515] Lin, W.- H.; Chiu, K. C.; Chang, H.- M.; Lee, K.- C.; Tai, T.- Y.; Chuang, L.- M. : Molecular scanning of the human sorbin and SH3- domain- containing- 1 (SORBS1) gene: positive association of the T228A polymorphism with obesity and type 2 diabetes. Hum. Molec. Genet. 10: 1753- 1760, 2001. ; and

[17516] Baumann, C. A.; Ribon, V.; Kanzaki, M.; Thurmond, D. C.; Mora, S.; Shigematsu, S.; Bickel, P. E.; Pessin, J. E.; Saltiel, A. R. : CAP defines a second signalling pathway required for insul.

[17517] Further studies establishing the function and utilities of SORBS1 are found in John Hopkins OMIM database record ID 605264, and in cited publications listed in Table 5, which are hereby incorporated by reference.Stromal antigen 2 (STAG2, Accession NP_006594.3) is another GAM99 target gene, herein designated TARGET GENE. STAG2

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by STAG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STAG2 BINDING SITE, designated SEQ ID:8903, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17518] Another function of GAM99 is therefore inhibition of Stromal antigen 2 (STAG2, Accession NP_006594.3) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAG2.

[17519] SWAP2 (Accession NP_008987.1) is another GAM99 target gene, herein designated TARGET GENE. SWAP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SWAP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SWAP2 BINDING SITE, designated SEQ ID:18106, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17520] Another function of GAM99 is therefore inhibition of SWAP2 (Accession NP_008987.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SWAP2.

[17521] T-box 19 (TBX19, Accession NP_005140.1) is another GAM99 target gene, herein designated TARGET GENE. TBX19 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TBX19, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBX19 BINDING SITE, designated SEQ ID:16617, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17522] Another function of GAM99 is therefore inhibition of T-box 19 (TBX19, Accession NP_005140.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX19.

[17523] Tolloid-like 2 (TLL2, Accession NP_036597.1) is another GAM99 target gene, herein designated TARGET GENE. TLL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TLL2, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TLL2 BINDING SITE, designated SEQ ID:17891, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17524] Another function of GAM99 is therefore inhibition of Tolloid-like 2 (TLL2, Accession NP_036597.1), a gene which induces cartilage and bone formation. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLL2.

[17525] The function of TLL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM67.2.Tumor necrosis factor (tnf superfamily, member 2) (TNF, Accession NP_000585.2) is another GAM99 target gene, herein designated TARGET GENE. TNF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNF BINDING

SITE, designated SEQ ID:3783, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17526] Another function of GAM99 is therefore inhibition of Tumor necrosis factor (tnf superfamily, member 2) (TNF, Accession NP_000585.2), a gene which mediates proinflammatory responses and apoptosis and therefore may be associated with Sepsis, cerebral malaria, multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus and crohn disease, as well as cancer. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Sepsis, cerebral malaria, multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus and crohn disease, as well as cancer, and of other diseases and clinical conditions associated with TNF.

[17527] The function of TNF has been established by previous studies. Ruuls and Sedgwick (1999) reviewed the problem of unlinking TNF biology from that of the MHC. Dysregulation and, in particular, overproduction of TNF have been implicated in a variety of human diseases, including sepsis, cerebral malaria, and autoimmune diseases such as multiple sclerosis (OMIM Ref. No. 126200), rheumatoid arthritis, systemic lupus erythematosus (OMIM Ref. No.

152700), and Crohn disease (see OMIM Ref. No. 266600), as well as cancer. Susceptibility to many of these diseases is thought to have a genetic basis, and the TNF gene is considered a candidate predisposing gene. However, unraveling the importance of genetic variation in the TNF gene to disease susceptibility or severity is complicated by its location within the MHC, a highly polymorphic region that encodes numerous genes involved in immunologic responses. Ruuls and Sedgwick (1999) reviewed studies that had analyzed the contribution of TNF and related genes to susceptibility to human disease, and they discussed how the presence of the TNF gene within the MHC may potentially complicate the interpretation of studies in animal models in which the TNF gene is experimentally manipulated.

[17528] Animal model experiments lend further support to the function of TNF. Bruce et al. (1996) used targeted gene disruption to generate mice lacking either the p55 or the p75 TNF receptors; mice lacking both p55 and p75 were generated from crosses of the singly deficient mice. The TNFR- deficient (TNFR- KO) mice exhibited no overt phenotype under unchallenged conditions. Bruce et al. (1996) reported that damage to neurons caused by focal cerebral

ischemia and epileptic seizures was exacerbated in the TNFR- KO mice, indicating that TNF serves a neuroprotective function. Their studies indicated that TNF protects neurons by stimulating antioxidative pathways. Injury- induced microglial activation was suppressed in TNFR- KO mice. They concluded that drugs which target TNF signaling pathways may prove beneficial in treating stroke or traumatic brain injury.

[17529] It is appreciated that the abovementioned animal model for TNF is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17530] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17531] Ruuls, S. R.; Sedgwick, J. D. : Unlinking tumor necrosis factor biology from the major histocompatibility complex: lessons from human genetics and animal models. Am. J. Hum. Genet. 65: 294- 301, 1999. ; and

[17532] Bruce, A. J.; Boling, W.; Kindy, M. S.; Peschon, J.; Kraemer, P. J.; Carpenter, M. K.; Holtsberg, F. W.; Mattson, M. P. : Altered neuronal and microglial responses to excitotoxic and is.

[17533] Further studies establishing the function and utilities of TNF are found in John Hopkins OMIM database record ID 191160, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transient receptor potential cation channel, subfamily c, member 1 (TRPC1, Accession NP_003295.1) is another GAM99 target gene, herein designated TARGET GENE. TRPC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRPC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRPC1 BINDING SITE, designated SEQ ID:18535, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17534] Another function of GAM99 is therefore inhibition of Transient receptor potential cation channel, subfamily c, member 1 (TRPC1, Accession NP_003295.1), a gene which acts as a non- voltage- sensitive store- operated Ca2+ channel. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC1.

[17535] The function of TRPC1 has been established by previous

studies. Zitt et al. (1996) cloned a truncated TRPC1 cDNA, which they designated TRPC1A, that lacks amino acids 109- 143 of the human TRP1 sequence. By transfection studies in Chinese hamster ovary cells, Zitt et al. (1996) showed that the TRPC1A gene product functions as a store- operated calcium- permeable cation channel. Zhu et al. (1996) similarly showed that TRPC1 increased store-operated calcium entry in transfected COS cells. Xu et al. (1997) reported that the TRPC1 and TRPC3 proteins form heteromultimeric complexes. Berg et al. (1997) stated that TRPC1 is expressed in megakaryocytic cell lines and therefore may play a role in calcium homeostasis in megakaryocytes and platelets.

[17536]

[17537] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17538] Zitt, C.; Zobel, A.; Obukhov, A. G.; Harteneck, C.; Kalk-brenner, F.; Luckhoff, A.; Schultz, G. : Cloning and func-tional expression of a human Ca(2+)- permeable cation channel activated by calcium store depletion. Neuron 16: 1189- 1196, 1996. ; and

[17539] Xu, X.- Z. S.; Li, H.- S.; Guggino, W. B.; Montell, C. :

Coassembly of TRP and TRPL produces a distinct store-operated conductance. Cell 89: 1155- 1164, 1997.

[17540] Further studies establishing the function and utilities of TRPC1 are found in John Hopkins OMIM database record ID 602343, and in cited publications listed in Table 5, which are hereby incorporated by reference.TU3A (Accession NP_009108.1) is another GAM99 target gene, herein designated TARGET GENE. TU3A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TU3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TU3A BINDING SITE, designated SEQ ID:18290, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17541] Another function of GAM99 is therefore inhibition of TU3A (Accession NP_009108.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU3A.

[17542] Ubiquilin 1 (UBQLN1, Accession NP_038466.2) is another GAM99 target gene, herein designated TARGET GENE. UBQLN1 BINDING SITE is a target binding site found in the

3` untranslated region of multiple transcripts of mRNA encoded by UBQLN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBQLN1 BINDING SITE, designated SEQ ID:17847, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17543] Another function of GAM99 is therefore inhibition of Ubiquilin 1 (UBQLN1, Accession NP_038466.2), a gene which may have a role in regulating cell cycle progression. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBQLN1.

[17544] The function of UBQLN1 has been established by previous studies. By screening a human nigra cDNA library with a rat DA41 cDNA as a probe, Hanaoka et al. (2000) isolated the human DA41 homolog. Human DA41 encodes a 589-amino acid protein with a predicted molecular mass of 62.4 kD. The protein shows 86% amino acid sequence identity with the rat protein, indicating the evolutionarily conserved structure and function of DA41. DA41 was expressed ubiquitously in adult human tissues, with rela-

tively higher levels in pituitary gland, adrenal gland, kidney, thymus, and placenta. By performing independent yeast 2- hybrid screens, Kleijnen et al. (2000) isolated cDNAs encoding PLIC1 and PLIC2 (UBQLN2; 300264), homologs of the mouse Plics (proteins linking integrin- associated protein (IAP; 601028) and cytoskeleton) and the yeast Dsk2 protein. PLIC1, also called UBQLN1, shares 72% amino acid identity with PLIC2. Two motifs are conserved in the mammalian PLICs and yeast Dsk2, an N- terminal ubiquitin (OMIM Ref. No. 191320)- like (UBL) domain and a C- terminal ubiquitin- associated (UBA) domain. Unlike ubiquitin, the UBL domain of the PLICs does not have a diglycine motif in its C terminus; the diglycine motif serves as a target site for cellular hydrolases that release ubiquitin from precursor fusion proteins. The absence of a GG sequence suggests that the UBL domain in the PLICs is an integral part of the open reading frame. The UBA domain is a loosely defined sequence motif present in multiple enzyme classes of the ubiquitination machinery. The most notable difference between the mammalian PLICs is the presence of a collagen- like motif in PLIC2 that is absent in PLIC1 and yeast Dsk2. This domain is most homologous to the collagen- like oncoprotein of herpesvirus

Saimiri, STP- C488, which is implicated in intracellular signaling via the RAS- RAF pathway (see OMIM Ref. No. 190020). The collagen- like domain of PLIC2 contains 8 PXGP motifs that are susceptible to cleavage by collagenase in vitro. Kleijnen et al (2000) showed that the human PLICs physically associate with both proteasomes and ubiquitin ligases in large complexes. Overexpression of PLICs interfered with the in vivo degradation of 2 unrelated ubiquitin- dependent proteasome substrates, p53 (OMIM Ref. No. 191170) and I- kappa- B- alpha (NFKBIA; 164008), but not a ubiquitin- independent substrate. These findings raised the possibility that the PLICs, and possibly related ubiquitin- like family members, may functionally link the ubiquitination machinery to the proteasome to affect in vivo protein degradation.

[17545]

[17546] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17547] Hanaoka, E.; Ozaki, T.; Ohira, M.; Nakamura, Y.; Suzuki, M.; Takahashi, E.; Moriya, H.; Nakagawara, A.; Sakiyama, S. : Molecular cloning and expression analysis of the human DA41 gene and its mapping to chromosome 9q21.2-

q21.3. J. Hum. Genet. 45: 188- 191, 2000. ; and

[17548] Kleijnen, M. F.; Shih, A. H.; Zhou, P.; Kumar, S.; Soccio, R. E.; Kedersha, N. L.; Gill, G.; Howley, P. M. : The hPLIC proteins may provide a link between the ubiquitination machinery.

[17549] Further studies establishing the function and utilities of UBQLN1 are found in John Hopkins OMIM database record ID 605046, and in cited publications listed in Table 5, which are hereby incorporated by reference.Uridine monophosphate synthetase (orotate phosphoribosyl transferase and orotidine-5'-decarboxylase) (UMPS, Accession NP_000364.1) is another GAM99 target gene, herein designated TARGET GENE. UMPS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UMPS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UMPS BINDING SITE, designated SEQ ID:15501, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17550] Another function of GAM99 is therefore inhibition of Uridine monophosphate synthetase (orotate phosphoribosyl

transferase and orotidine-5'-decarboxylase) (UMPS, Accession NP_000364.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UMPS.

[17551] Was protein family, member 3 (WASF3, Accession NP_006637.2) is another GAM99 target gene, herein designated TARGET GENE. WASF3 BINDING SITE1 and WASF3 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by WASF3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WASF3 BINDING SITE1 and WASF3 BINDING SITE2, designated SEQ ID:16728 and SEQ ID:7833 respectively, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17552] Another function of GAM99 is therefore inhibition of Was protein family, member 3 (WASF3, Accession NP_006637.2), a gene which stimulates actin polymerization. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WASF3.

[17553] The function of WASF3 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM65.2.Extracellular link domain containing 1 (XLKD1, Accession NP_006682.1) is another GAM99 target gene, herein designated TARGET GENE. XLKD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by XLKD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of XLKD1 BINDING SITE, designated SEQ ID:11348, to the nucleotide sequence of GAM99 RNA, herein designated GAM RNA, also designated SEQ ID:320.

[17554] Another function of GAM99 is therefore inhibition of Extracellular link domain containing 1 (XLKD1, Accession NP_006682.1) . Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XLKD1.

[17555]

[17556] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 100 (GAM100), which modulates expression of respective tar-

get genes thereof, the function and utility of which target genes is known in the art.

[17557] GAM100 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM100 was detected is described hereinabove with reference to Figs. 8-15.

[17558] GAM100 gene, herein designated GAM GENE, and GAM100 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[17559] GAM100 gene encodes a GAM100 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM100 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM100 precursor RNA is designated SEQ ID:91, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:91 is located at position 56 relative to chromosome 7.

[17560] GAM100 precursor RNA folds onto itself, forming GAM100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17561] GAM100 precursor RNA folds onto itself, forming GAM100 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[17562] Nucleotide sequence of GAM100 precursor RNA, designated SEQ-ID: 91, and a schematic representation of a predicted secondary folding of GAM100 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[17563] An enzyme complex designated DICER COMPLEX, `dices` the GAM100 folded precursor RNA into GAM100 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: A) nucleotide sequence of GAM100 RNA is designated SEQ ID:243, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[17564] GAM100 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM100 target RNA, herein designated GAM TARGET RNA. GAM100 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17565] GAM100 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM100 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM100 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING

SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM100 RNA may have a different number of target binding sites in untranslated regions of a GAM100 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17566] The complementary binding of GAM100 RNA, herein designated GAM RNA, to target binding sites on GAM100 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM100 target RNA into GAM100 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17567] It is appreciated that GAM100 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM100 target genes. The mRNA of each one of this plurality of GAM100 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM100 RNA,

herein designated GAM RNA, and which when bound by GAM100 RNA causes inhibition of translation of respective one or more GAM100 target proteins.

[17568] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM100 gene, herein designated GAM GENE, on one or more GAM100 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17569] It is appreciated that specific functions and accordingly utilities of GAM100 correlate with, and may be deduced from, the identity of the target genes which GAM100 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[17570]

[17571]

[17572] Acyl-coenzyme a dehydrogenase, short/branched chain (ACADSB, Accession NP_001600.1) is a GAM100 target gene, herein designated TARGET GENE. ACADSB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACADSB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACADSB BINDING SITE, designated SEQ ID:9071, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17573] A function of GAM100 is therefore inhibition of Acyl-coenzyme a dehydrogenase, short/branched chain (ACADSB, Accession NP_001600.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADSB.

[17574] S-adenosylmethionine decarboxylase 1 (AMD1, Accession NP_001625.1) is another GAM100 target gene, herein

designated TARGET GENE. AMD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AMD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AMD1 BINDING SITE, designated SEQ ID:693, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17575] Another function of GAM100 is therefore inhibition of S-adenosylmethionine decarboxylase 1 (AMD1, Accession NP_001625.1), a gene which catalyzes the removal of the carboxylate group of S- adenosylmethionine in the polyamine biosynthesis pathway. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMD1.

[17576] The function of AMD1 has been established by previous studies. The polyamines spermine, spermidine, and putrescine are low molecular weight aliphatic amines essential for cellular proliferation and tumor promotion. Ornithine decarboxylase (ODC; 165640) and S- adenosylmethionine decarboxylase (AdoMetDC) catalyze the rate-limiting steps in polyamine biosynthesis. A concordant rise in ODC and AdoMetDC activity is seen in various neo-

plastic conditions including colon cancer and benign colonic polyps. A rat cDNA clone for AdoMetDC was used by Radford et al. (1987, 1989) in mouse- human somatic cell hybrid experiments to map the AMD gene to chromosomes 6 and X. They demonstrated that the gene on chromosome 6, symbolized AMD1, is not amplified in colon neoplasia. The sequence on X, symbolized AMD2, was localized to Xq22- q28 and may represent a pseudogene. That AMD2 is indeed a pseudogene was indicated by the findings of Maric et al. (1992) that the X- chromosome gene lacks introns which are present in the chromosome 6 gene. The gene on chromosome 6 encompasses at least 22 kb and comprises 9 exons and 8 introns, in contrast to the corresponding rat gene that has only 8 exons. Other aspects of the structure and organization were presented by Maric et al. (1992). Pulkka et al. (1993) characterized 2 AMD genes in the rat and localized both to rat chromosome 20 by mouse- rat somatic cell hybrids. They showed a high degree of conservation of sequence and structural organization in the coding portions but the 5-prime flanking regions were totally different. Maric et al. (1995) characterized the AMD pseudogene on the X chromosome. It lacks all the introns present in AMD1 and has

numerous mutations in the protein- coding region. By fluorescence in situ hybridization, they mapped AMD1 to 6q21- q22 and the pseudogene, which they referred to as AMD2, to Xq28.

[17577]

[17578] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17579] Maric, S. C.; Crozat, A.; Janne, O. A. : Structure and organization of the human S- adenosylmethionine decarboxylase gene. J. Biol. Chem. 267: 18915- 18923, 1992. ; and

[17580] Maric, S. C.; Crozat, A.; Louhimo, J.; Knuutila, S.; Janne, O. A. : The human S- adenosylmethionine decarboxylase gene: nucleotide sequence of a pseudogene and chromosomal localization o.

[17581] Further studies establishing the function and utilities of AMD1 are found in John Hopkins OMIM database record ID 180980, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adp-ribosylation factor 3 (ARF3, Accession NP_001650.1) is another GAM100 target gene, herein designated TARGET GENE. ARF3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARF3, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARF3 BINDING SITE, designated SEQ ID:11427, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17582] Another function of GAM100 is therefore inhibition of Adp-ribosylation factor 3 (ARF3, Accession NP_001650.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF3.

[17583] ARHGAP11A (Accession NP_055598.1) is another GAM100 target gene, herein designated TARGET GENE. ARHGAP11A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHGAP11A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGAP11A BINDING SITE, designated SEQ ID:8456, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17584] Another function of GAM100 is therefore inhibition of

ARHGAP11A (Accession NP_055598.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP11A.

[17585] Atpase, h+ transporting, lysosomal 42kda, v1 subunit c isoform 2 (ATP6V1C2, Accession NP_653184.1) is another GAM100 target gene, herein designated TARGET GENE. ATP6V1C2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP6V1C2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP6V1C2 BINDING SITE, designated SEQ ID:15117, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17586] Another function of GAM100 is therefore inhibition of Atpase, h+ transporting, lysosomal 42kda, v1 subunit c isoform 2 (ATP6V1C2, Accession NP_653184.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1C2.

[17587] Btb and cnc homology 1, basic leucine zipper transcrip-

tion factor 1 (BACH1, Accession NP_001177.1) is another GAM100 target gene, herein designated TARGET GENE. BACH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BACH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACH1 BINDING SITE, designated SEQ ID:4647, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17588] Another function of GAM100 is therefore inhibition of Btb and cnc homology 1, basic leucine zipper transcription factor 1 (BACH1, Accession NP_001177.1), a gene which acts as repressor or activator, binds to nf- e2 binding sites. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH1.

[17589] The function of BACH1 has been established by previous studies. Members of the small Maf family are basic region leucine zipper (bZip) proteins that can function as transcriptional activators or repressors (see OMIM Ref. No. MAFG, 602020). Small Maf proteins can switch from transcriptional repressors to activators, depending on the

proteins with which they form heterodimers. Using a yeast 2 hybrid screen to identify MafK (OMIM Ref. No. 600197) heterodimerization partners, Oyake et al. (1996) identified mouse cDNAs encoding Bach1 and Bach2. Both Bach proteins contained a BTB (broad complex- tramtrack- bric-a- brac) or POZ (poxvirus and zinc finger) protein interaction domain and a CNC (Cap'n'collar)- type bZip domain. Oyake et al. (1996) demonstrated that Bach1 and Bach2 (OMIM Ref. No. 605394) form heterodimers with MafK, and function as transcriptional activators or repressors when expressed in mammalian cells. Therefore, the authors suggested that the Bach proteins play important roles in coordinating transcription activation and repression by MafK. While developing a physical map of chromosome 21, both Ohira et al. (1998) and Blouin et al. (1998) isolated cDNAs encoding human BACH1. Ohira et al. (1998) reported that the sequence of the predicted 736- amino acid human protein is 80% identical to that of mouse Bach1. Human BACH1, like mouse Bach1, contains a BTB domain and CNC bZip domain. Northern analysis revealed that BACH1 is expressed ubiquitously as a 5.5-kb mRNA. An additional strong 3- kb signal was seen in testis.

[17590]

[17591] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17592] Ohira, M.; Seki, N.; Nagase, T.; Ishikawa, K.; Nomura, N.; Ohara, O. : Characterization of a human homolog (BACH1) of the mouse Bach1 gene encoding a BTB- basic leucine zipper transcription factor and its mapping to chromosome 21q22.1. Genomics 47: 300- 306, 1998. ; and

[17593] Oyake, T.; Itoh, K.; Motohashi 1. Blouin, J.- L.; Sail, G. D.; Guipponi, M.; Rossier, C.; Pappasavas, M.- P.; Antonarakis, S. E. : Isolation of the human BACH1 transcription regulator gene.

[17594] Further studies establishing the function and utilities of BACH1 are found in John Hopkins OMIM database record ID 602751, and in cited publications listed in Table 5, which are hereby incorporated by reference.Btb and cnc homology 1, basic leucine zipper transcription factor 2 (BACH2, Accession NP_068585.1) is another GAM100 target gene, herein designated TARGET GENE. BACH2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BACH2, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BACH2 BINDING SITE, designated SEQ ID:8027, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17595] Another function of GAM100 is therefore inhibition of Btb and cnc homology 1, basic leucine zipper transcription factor 2 (BACH2, Accession NP_068585.1), a gene which acts as repressor or activator, binds to maf recognition elements and therefore may be associated with Non-hodgkin lymphoma. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of Non-hodgkin lymphoma, and of other diseases and clinical conditions associated with BACH2.

[17596] The function of BACH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Bcl2-associated athanogene 2 (BAG2, Accession NP_004273.1) is another GAM100 target gene, herein designated TARGET GENE. BAG2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BAG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAG2 BINDING SITE, designated SEQ ID:9686, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17597] Another function of GAM100 is therefore inhibition of Bcl2-associated athanogene 2 (BAG2, Accession NP_004273.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG2.

[17598] BLP2 (Accession NP_079417.1) is another GAM100 target gene, herein designated TARGET GENE. BLP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BLP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BLP2 BINDING SITE, designated SEQ ID:6931, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17599] Another function of GAM100 is therefore inhibition of BLP2 (Accession NP_079417.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLP2.

[17600] BLP2 (Accession NP_510883.1) is another GAM100 target gene, herein designated TARGET GENE. BLP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BLP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BLP2 BINDING SITE, designated SEQ ID:6931, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17601] Another function of GAM100 is therefore inhibition of BLP2 (Accession NP_510883.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLP2.

[17602] C10orf5 (Accession XP_172843.1) is another GAM100 target gene, herein designated TARGET GENE. C10orf5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C10orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C10orf5 BINDING SITE, designated SEQ ID:16299, to the nucleotide sequence of GAM100

RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17603] Another function of GAM100 is therefore inhibition of C10orf5 (Accession XP_172843.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C10orf5.

[17604] C14orf146 (Accession NP_689660.2) is another GAM100 target gene, herein designated TARGET GENE. C14orf146 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C14orf146, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf146 BINDING SITE, designated SEQ ID:10104, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17605] Another function of GAM100 is therefore inhibition of C14orf146 (Accession NP_689660.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf146.

[17606] Chromosome 20 open reading frame 64 (C20orf64, Ac-

cession NP_291028.2) is another GAM100 target gene, herein designated TARGET GENE. C20orf64 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf64, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf64 BINDING SITE, designated SEQ ID:19464, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17607] Another function of GAM100 is therefore inhibition of Chromosome 20 open reading frame 64 (C20orf64, Accession NP_291028.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf64.

[17608] C6orf151 (Accession NP_689764.1) is another GAM100 target gene, herein designated TARGET GENE. C6orf151 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C6orf151, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf151 BINDING SITE, designated SEQ ID:12717, to the

nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17609] Another function of GAM100 is therefore inhibition of C6orf151 (Accession NP_689764.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf151.

[17610] Chromosome 9 open reading frame 5 (C9orf5, Accession NP_114401.1) is another GAM100 target gene, herein designated TARGET GENE. C9orf5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C9orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C9orf5 BINDING SITE, designated SEQ ID:14642, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17611] Another function of GAM100 is therefore inhibition of Chromosome 9 open reading frame 5 (C9orf5, Accession NP_114401.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf5.

[17612] Calmodulin binding transcription activator 1 (CAMTA1, Accession XP_042323.7) is another GAM100 target gene, herein designated TARGET GENE. CAMTA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAMTA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CAMTA1 BINDING SITE, designated SEQ ID:10875, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17613] Another function of GAM100 is therefore inhibition of Calmodulin binding transcription activator 1 (CAMTA1, Accession XP_042323.7) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMTA1.

[17614] Cholecystokinin b receptor (CCKBR, Accession NP_000722.2) is another GAM100 target gene, herein designated TARGET GENE. CCKBR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCKBR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates

the complementarity of the nucleotide sequences of CCKBR BINDING SITE, designated SEQ ID:3824, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17615] Another function of GAM100 is therefore inhibition of Cholecystokinin b receptor (CCKBR, Accession NP_000722.2), a gene which bonds cholecystokinin, regulates emotion and gastric acid secretion. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCKBR.

[17616] The function of CCKBR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Cholecystokinin b receptor (CCKBR, Accession NP_795344.1) is another GAM100 target gene, herein designated TARGET GENE. CCKBR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCKBR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCKBR BINDING SITE, designated SEQ ID:3824, to the nu-

cleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17617] Another function of GAM100 is therefore inhibition of Cholecystokinin b receptor (CCKBR, Accession NP_795344.1), a gene which bonds cholecystokinin, regulates emotion and gastric acid secretion. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCKBR.

[17618] The function of CCKBR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Chemokine (c-c motif) receptor 9 (CCR9, Accession NP_006632.2) is another GAM100 target gene, herein designated TARGET GENE. CCR9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCR9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCR9 BINDING SITE, designated SEQ ID:2819, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17619] Another function of GAM100 is therefore inhibition of Chemokine (c-c motif) receptor 9 (CCR9, Accession NP_006632.2), a gene which binds beta- chemokine family and subsequently transduces a signal by increasing the intracellular calcium ions level. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR9.

[17620] The function of CCR9 has been established by previous studies. Chemokines are small peptides involved in the chemotaxis and activation of leukocytes in response to inflammation, tissue damage, or infection. Chemokine receptors belong to the superfamily of G protein- coupled receptors. See CMKBR1 (OMIM Ref. No. 601159) for background. Nibbs et al. (1997) stated that they had previously identified the mouse cysteine- cysteine (C- C) chemokine receptor D6. To identify the human homolog of D6, they performed PCR on human genomic DNA using primers based on the sequence of the mouse D6 gene. The human D6 gene encodes a predicted 384- amino acid protein that contains the characteristic 7 transmembrane domains and 4 conserved cysteine residues of chemokine receptors. The human and mouse D6 proteins share 71% amino acid identity. By Northern blot analysis, human D6 is ex-

pressed as approximately 4- and 6- kb transcripts in several tissues, with the highest expression in placenta. Although human D6 binds with relatively high- affinity to the majority of members of the beta- chemokine family (for example, MCP2; 602283), Nibbs et al. (1997) were unable to demonstrate any signaling following the ligand binding. Therefore, the International Union of Pharmacology (OMIM Ref. No. IUPHAR) proposed that the human D6 receptor be designated ccr9, with the lower cases indicating that receptor function has not been demonstrated. Bonini et al. (1997) cloned a cDNA encoding CMKBR9, which they called CCR10 because it is homologous to rat 'Ccr10- related receptor' (Ccr10rR). The CMKBR9 and rat Ccr10rR proteins have 72% amino acid identity. By PCR of a radiation hybrid panel, Bonini et al. (1997) mapped the CMKBR9 (CCBP2) gene to 3p21.32- p21.31, a region containing other C- C chemokine receptor genes such as CMKBR1, CMKBR2 (OMIM Ref. No. 601267), CMKBR3 (OMIM Ref. No. 601268), and CMKBR5 (OMIM Ref. No. 601373). By radiation hybrid analysis and organization of BAC contigs by FISH on combed genomic DNA, Maho et al. (1999) localized the CCBP2 gene within the CCR cluster at 3p21.3.

[17621]

[17622] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17623] Nibbs, R. J. B.; Wylie, S. M.; Yang, J.; Landau, N. R.; Graham, G. J. : Cloning and characterization of a novel promiscuous human beta- chemokine receptor D6. J. Biol. Chem. 272: 32078- 32083, 1997. ; and

[17624] Bonini, J. A.; Martin, S. K.; Dralyuk, F.; Roe, M. W.; Philipson, L. H.; Steiner, D. F. : Cloning, expression, and chromosomal mapping of a novel human CC- chemokine receptor (CCR10) that.

[17625] Further studies establishing the function and utilities of CCR9 are found in John Hopkins OMIM database record ID 602648, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chemokine (c-c motif) receptor 9 (CCR9, Accession NP_112477.1) is another GAM100 target gene, herein designated TARGET GENE. CCR9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCR9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of CCR9 BINDING SITE, designated SEQ ID:2819, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17626] Another function of GAM100 is therefore inhibition of Chemokine (c-c motif) receptor 9 (CCR9, Accession NP_112477.1), a gene which binds beta- chemokine family and subsequently transduces a signal by increasing the intracellular calcium ions level. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR9.

[17627] The function of CCR9 has been established by previous studies. Chemokines are small peptides involved in the chemotaxis and activation of leukocytes in response to inflammation, tissue damage, or infection. Chemokine receptors belong to the superfamily of G protein- coupled receptors. See CMKBR1 (OMIM Ref. No. 601159) for background. Nibbs et al. (1997) stated that they had previously identified the mouse cysteine- cysteine (C- C) chemokine receptor D6. To identify the human homolog of D6, they performed PCR on human genomic DNA using primers based on the sequence of the mouse D6 gene. The human D6 gene encodes a predicted 384- amino acid protein that contains the characteristic 7 transmembrane domains

and 4 conserved cysteine residues of chemokine receptors. The human and mouse D6 proteins share 71% amino acid identity. By Northern blot analysis, human D6 is expressed as approximately 4- and 6- kb transcripts in several tissues, with the highest expression in placenta. Although human D6 binds with relatively high- affinity to the majority of members of the beta- chemokine family (for example, MCP2; 602283), Nibbs et al. (1997) were unable to demonstrate any signaling following the ligand binding. Therefore, the International Union of Pharmacology (OMIM Ref. No. IUPHAR) proposed that the human D6 receptor be designated ccr9, with the lower cases indicating that receptor function has not been demonstrated. Bonini et al. (1997) cloned a cDNA encoding CMKBR9, which they called CCR10 because it is homologous to rat 'Ccr10- related receptor' (Ccr10rR). The CMKBR9 and rat Ccr10rR proteins have 72% amino acid identity. By PCR of a radiation hybrid panel, Bonini et al. (1997) mapped the CMKBR9 (CCBP2) gene to 3p21.32- p21.31, a region containing other C- C chemokine receptor genes such as CMKBR1, CMKBR2 (OMIM Ref. No. 601267), CMKBR3 (OMIM Ref. No. 601268), and CMKBR5 (OMIM Ref. No. 601373). By radiation hybrid analysis and organization of

BAC contigs by FISH on combed genomic DNA, Maho et al. (1999) localized the CCBP2 gene within the CCR cluster at 3p21.3.

[17628]

[17629] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17630] Nibbs, R. J. B.; Wylie, S. M.; Yang, J.; Landau, N. R.; Graham, G. J. : Cloning and characterization of a novel promiscuous human beta- chemokine receptor D6. J. Biol. Chem. 272: 32078- 32083, 1997. ; and

[17631] Bonini, J. A.; Martin, S. K.; Dralyuk, F.; Roe, M. W.; Philipson, L. H.; Steiner, D. F. : Cloning, expression, and chromosomal mapping of a novel human CC- chemokine receptor (CCR10) that.

[17632] Further studies establishing the function and utilities of CCR9 are found in John Hopkins OMIM database record ID 602648, and in cited publications listed in Table 5, which are hereby incorporated by reference.CG012 (Accession XP_096710.1) is another GAM100 target gene, herein designated TARGET GENE. CG012 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CG012, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CG012 BINDING SITE, designated SEQ ID:20065, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17633] Another function of GAM100 is therefore inhibition of CG012 (Accession XP_096710.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG012.

[17634] Claudin 12 (CLDN12, Accession NP_036261.1) is another GAM100 target gene, herein designated TARGET GENE. CLDN12 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLDN12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CLDN12 BINDING SITE, designated SEQ ID:8251, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17635] Another function of GAM100 is therefore inhibition of Claudin 12 (CLDN12, Accession NP_036261.1) . Accordingly, utilities of GAM100 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with CLDN12.

[17636] Collagen, type xxi, alpha 1 (COL21A1, Accession NP_110447.2) is another GAM100 target gene, herein designated TARGET GENE. COL21A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COL21A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL21A1 BINDING SITE, designated SEQ ID:15079, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17637] Another function of GAM100 is therefore inhibition of Collagen, type xxi, alpha 1 (COL21A1, Accession NP_110447.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL21A1.

[17638] CPGL2 (Accession NP_116038.4) is another GAM100 target gene, herein designated TARGET GENE. CPGL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CPGL2, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPGL2 BINDING SITE, designated SEQ ID:10752, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17639] Another function of GAM100 is therefore inhibition of CPGL2 (Accession NP_116038.4) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPGL2.

[17640] Cytochrome p450, subfamily viia (cholesterol 7 alpha-monooxygenase), polypeptide 1 (CYP7A1, Accession NP_000771.1) is another GAM100 target gene, herein designated TARGET GENE. CYP7A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP7A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP7A1 BINDING SITE, designated SEQ ID:2570, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17641] Another function of GAM100 is therefore inhibition of Cytochrome p450, subfamily viia (cholesterol 7 alpha-

monooxygenase), polypeptide 1 (CYP7A1, Accession NP_000771.1), a gene which functions in cholesterol and bile acid metabolism . and therefore may be associated with Metabolic liver disease. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of Metabolic liver disease, and of other diseases and clinical conditions associated with CYP7A1.

[17642] The function of CYP7A1 has been established by previous studies. In an elegant series of experiments designed to understand the effect of retinoid X receptor (RXR; OMIM Ref. No. 180245) activation on cholesterol balance, Repa et al. (2000) treated animals with the rexinoid LG268. Animals treated with rexinoid exhibited marked changes in cholesterol balance, including inhibition of cholesterol absorption and repressed bile acid synthesis. Studies with receptor- selective agonists revealed that oxysterol receptors (LXRs, OMIM Ref. No. 602423 and 600380) and the bile acid receptor, FXR (OMIM Ref. No. 603826), are the RXR heterodimeric partners that mediate these effects by regulating expression of the reverse- cholesterol transporter, ABC1 (OMIM Ref. No. 600046), and the rate- limiting enzyme of bile acid synthesis, CYP7A1, respectively. These RXR heterodimers serve as key regulators in

cholesterol homeostasis by governing reverse cholesterol transport from peripheral tissues, bile acid synthesis in liver, and cholesterol absorption in intestine. Activation of RXR/LXR heterodimers inhibits cholesterol absorption by upregulation of ABC1 expression in the small intestine. Activation of RXR/FXR heterodimers represses CYP7A1 expression and bile acid production, leading to a failure to solubilize and absorb cholesterol. Studies have shown that RXR/FXR- mediated repression of CYP7A1 is dominant over RXR/LXR- mediated induction of CYP7A1, which explains why the rexinoid represses rather than activates CYP7A1 (Lu et al., 2000). Activation of the LXR signaling pathway results in the upregulation of ABC1 in peripheral cells, including macrophages, to efflux free cholesterol for transport back to the liver through high density lipoprotein, where it is converted to bile acids by the LXR- mediated increase in CYP7A1 expression. Secretion of biliary cholesterol in the presence of increased bile acid pools normally results in enhanced reabsorption of cholesterol; however, with the increased expression of ABC1 and efflux of cholesterol back into the lumen, there is a reduction in cholesterol absorption and net excretion of cholesterol and bile acid. Rexinoids therefore offer a novel class

of agents for treating elevated cholesterol. Agellon et al. (2002) found that wildtype mice and mice transgenic for human CYP7A1 respond differently to cholesterol feeding. Cholesterol feeding stimulated Cyp7a1 mRNA abundance and enzymatic activity in wildtype mice, but repressed human CYP7A1 mRNA and activity in transgenic mice. In transfected hepatoma cells, cholesterol increased mouse Cyp7a1 gene promoter activity, but had no effect on the human CYYP7A1 gene promoter. By electrophoretic mobility shift assays, Agellon et al. (2002) found interaction of LXR:RXR with the mouse promoter, but no binding to the human promoter.

[17643]

transgeni.

[17647] Further studies establishing the function and utilities of CYP7A1 are found in John Hopkins OMIM database record ID 118455, and in cited publications listed in Table 5, which are hereby incorporated by reference.DKFZp434A171 (Accession NP_115626.1) is another GAM100 target gene, herein designated TARGET GENE. DKFZp434A171 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434A171, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434A171 BINDING SITE, designated SEQ ID:8438, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17648] Another function of GAM100 is therefore inhibition of DKFZp434A171 (Accession NP_115626.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434A171.

[17649] DKFZp434N2030 (Accession XP_037555.8) is another GAM100 target gene, herein designated TARGET GENE.

DKFZp434N2030 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434N2030, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434N2030 BINDING SITE, designated SEQ ID:8864, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17650] Another function of GAM100 is therefore inhibition of DKFZp434N2030 (Accession XP_037555.8) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434N2030.

[17651] DKFZP564D166 (Accession NP_108648.1) is another GAM100 target gene, herein designated TARGET GENE. DKFZP564D166 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DKFZP564D166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564D166 BINDING SITE, designated SEQ ID:11086, to

the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17652] Another function of GAM100 is therefore inhibition of DKFZP564D166 (Accession NP_108648.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D166.

[17653] DKFZp566H0824 (Accession NP_060005.1) is another GAM100 target gene, herein designated TARGET GENE. DKFZp566H0824 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp566H0824, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp566H0824 BINDING SITE, designated SEQ ID:15799, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17654] Another function of GAM100 is therefore inhibition of DKFZp566H0824 (Accession NP_060005.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566H0824.

[17655] DKFZp667M2411 (Accession XP_290795.1) is another GAM100 target gene, herein designated TARGET GENE. DKFZp667M2411 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp667M2411, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp667M2411 BINDING SITE, designated SEQ ID:13698, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17656] Another function of GAM100 is therefore inhibition of DKFZp667M2411 (Accession XP_290795.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp667M2411.

[17657] DKFZp761O17121 (Accession NP_115663.1) is another GAM100 target gene, herein designated TARGET GENE. DKFZp761O17121 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp761O17121, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of DKFZp761O17121 BINDING SITE, designated SEQ ID:1198, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17658] Another function of GAM100 is therefore inhibition of DKFZp761O17121 (Accession NP_115663.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761O17121.

[17659] Dentin matrix acidic phosphoprotein (DMP1, Accession NP_004398.1) is another GAM100 target gene, herein designated TARGET GENE. DMP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DMP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMP1 BINDING SITE, designated SEQ ID:5295, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17660] Another function of GAM100 is therefore inhibition of Dentin matrix acidic phosphoprotein (DMP1, Accession NP_004398.1), a gene which regulates mineralization of bone and dentin. Accordingly, utilities of GAM100 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with DMP1.

[17661] The function of DMP1 has been established by previous studies. George et al. (1993) isolated a dentin matrix acidic phosphoprotein from a rat odontoblast cDNA library. It is a serine- rich acidic protein that has numerous potential phosphorylation sites, especially for messenger-independent kinases of the casein kinase II group. Expression analysis showed that dmp1 message is essentially dentin- specific. The mouse dmp1 gene was mapped to 5q21, a region of the mouse genome that shows homology of synteny with human 4q21. Dentinogenesis imperfecta type II (OMIM Ref. No. 125490) maps to that region of the genome, namely 4q13- q21. This prompted Aplin et al. (1995) to isolate a cosmid containing the human DMP1 gene. The isolation of a short tandem repeat polymorphism at this locus allowed them to map DMP1 to 4q21 and demonstrate that it is tightly linked to DGI1 in 2 families. The creation of a YAC contig around the gene for osteopontin (OMIM Ref. No. 166490) allowed them to demonstrate that DMP1 is located within 150 kb of the bone sialoprotein locus (OMIM Ref. No. 147563) and within 490 kb of the SPP1 locus. Mutation search in both

SPP1 and IBSP in individuals with dentinogenesis imperfecta yielded negative results. DMP1 is a candidate for similar mutation screen. MacDougall et al. (1996) used fluorescence in situ hybridization to map DMP1 to 4q21. By screening a cDNA library constructed from mandibular and maxillary third molars with the mouse Dmp1 sequence as the probe, Hirst et al. (1997) isolated a cDNA encoding DMP1. The deduced 513- amino acid, highly acidic, serine- rich protein has a hydrophobic signal peptide, an Arg- Gly- Asp cell- attachment sequence, and numerous potential serine phosphorylation sites. Genomic sequence analysis indicated that the DMP1 gene contains 6 exons, and no disease- specific mutations were identified in 2 families with type II dentinogenesis imperfecta.

[17662]

[17663] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17664] Hirst, K. L.; Simmons, D.; Feng, J.; Aplin, H.; Dixon, M. J.; MacDougall, M. : Elucidation of the sequence and the genomic organization of the human dentin matrix acidic phosphoprotein 1 (DMP1) gene: exclusion of the locus from a causative role in the pathogenesis of dentinogene-

sis imperfecta type II. Genomics 42: 38- 45, 1997. ; and

[17665] MacDougall, M.; DuPont, B. R.; Simmons, D.; Leach, R. J. : Assignment of DMP1 to human chromosome 4 band q21 by in situ hybridization. Cytogenet. Cell. Genet. 74: 189 only, 1996.

[17666] Further studies establishing the function and utilities of DMP1 are found in John Hopkins OMIM database record ID 600980, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dystrobrevin, beta (DTNB, Accession NP_149159.1) is another GAM100 target gene, herein designated TARGET GENE. DTNB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DTNB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DTNB BINDING SITE, designated SEQ ID:17907, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17667] Another function of GAM100 is therefore inhibition of Dystrobrevin, beta (DTNB, Accession NP_149159.1), a gene which is a part of a dystrophin- associated protein complex . and therefore may be associated with Limb-

girdle muscular dystrophy. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of Limb- girdle muscular dystrophy, and of other diseases and clinical conditions associated with DTNB.

[17668] The function of DTNB has been established by previous studies. Dystrophin, a component of muscle that is defective in Duchenne muscular dystrophy (DMD; 310200), binds to a complex of proteins and glycoproteins, the dystrophin- associated protein complex (DPC), which effectively forms a transmembrane link between the extracellular matrix, and the cytoskeleton of the muscle fiber. The DPC can be divided into 3 subcomplexes: the dystroglycan complex, the sarcoglycan complex, and the cytoplasmic complex. The dystroglycan complex consists of 2 proteins, alpha- and beta- dystroglycan (DAG1, 128239; DAG2, 600119), that bind to laminin and dystrophin, respectively. The sarcoglycan complex is composed of 4 transmembrane glycoproteins: alpha-, beta-, gamma-, and delta- sarcoglycan, and a 25- kD protein 25DAP. Mutations in all 4 sarcoglycan genes have been found in patients with different forms of limb- girdle muscular dystrophy. The cytoplasmic component of the DPC is composed of the syntrophin family of related proteins and the

dystrophin- related protein, dystrobrevin. Peters et al. (1997) described beta- dystrobrevin. They cloned cDNAs from human liver libraries that encode a 627- amino acid polypeptide with a predicted molecular weight of 71 kD. The protein copurified with the dystrobrevin short form, Dp71. The mammalian dystrobrevin genes encode several protein isoforms that are expressed in different tissues, including brain and muscle. Blake et al. (1998) designated the isoform expressed in muscle as alpha- dystrobrevin and used the designation beta- dystrobrevin for the dystrophin- related protein they found to be abundantly expressed in brain and other tissues but not in muscle. Beta- dystrobrevin is encoded by a 2.5- kb alternatively spliced transcript that is found throughout the brain. In common with dystrophin, beta- dystrobrevin is found in neurons of the cortex and hippocampal formation, but it is not found in the brain microvasculature. In the brain, beta- dystrobrevin coprecipitates with the dystrophin isoforms Dp71 and Dp140. The findings of Blake et al. (1998) indicated that the composition of the dystrophin-associated protein complex in the brain differs from that in muscle. Because beta- dystrobrevin and dystrophin are expressed in similar populations of neurons in the hip-

pocampus and cortex, it is possible that beta- dystrobrevin interacts directly with dystrophin. If this is the case, then beta- dystrobrevin levels may be reduced in DMD patients similar to the reduction in sarcolemmal staining seen with other components of the DPC in dystrophic muscle. The findings may be relevant to the cognitive dysfunction affecting many patients with Duchenne muscular dystrophy.

[17669]

[17670] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17671] Blake, D. J.; Nawrotzki, R.; Loh, N. Y.; Gorecki, D. C.; Davies, K. E. : Beta- dystrobrevin, a member of the dystrophin- related protein family. Proc. Nat. Acad. Sci. 95: 241- 246, 1998. ; and

[17673] Further studies establishing the function and utilities of DTNB are found in John Hopkins OMIM database record ID 602415, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Dysferlin, limb girdle muscular dystrophy 2b (autosomal recessive) (DYSF, Accession NP_003485.1) is another GAM100 target gene, herein designated TARGET GENE. DYSF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DYSF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DYSF BINDING SITE, designated SEQ ID:17950, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17674] Another function of GAM100 is therefore inhibition of Dysferlin, limb girdle muscular dystrophy 2b (autosomal recessive) (DYSF, Accession NP_003485.1), a gene which is highly expressed in skeletal muscle. and therefore is associated with Miyoshi myopathy, limb girdle muscular dystrophy type 2b. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of Miyoshi myopathy, limb girdle muscular dystrophy type 2b, and of other diseases and clinical conditions associated with DYSF.

[17675] The function of DYSF has been established by previous

studies. The limb- girdle muscular dystrophies are a genetically heterogeneous group of inherited progressive muscular disorders that affect mainly the proximal musculature, with evidence for at least 3 autosomal dominant and 8 autosomal recessive loci. The recessive forms for the most part involve mutations in genes encoding components of the dystrophin- associated complex; another form, LGMD2A (OMIM Ref. No. 253600), is caused by mutations in the gene for the muscle- specific protease calpain 3 (CAPN3; 114340). Miyoshi myopathy (MM; 254130) is an adult- onset, recessively inherited distal muscular dystrophy that maps to 2p13. A form of recessive limb-girdle muscular dystrophy, designated LGMD2B (OMIM Ref. No. 253601), maps to the same chromosomal region. This raised the possibility that MM and LGMD2B are allelic disorders. In fact they were shown to be varying expressions of the same mutant gene; 2 large, inbred kindreds whose members included both MM and LGMD2B patients were described by Weiler et al. (1996) and Illarioshkin et al. (1996, 1997). Affected individuals in both pedigrees shared the same haplotype. Differences in the phenotype appeared to be due to additional modifying factors. Liu et al. (1998) constructed a 3- Mb PAC contig spanning the

MM candidate region. This clarified the order of genetic markers across the area, provided 5 new polymorphic markers within it, and narrowed the locus to approximately 2 Mb. They found 5 skeletal muscle ESTs that mapped in this region. Liu et al. (1998) reported that 1 of these ESTs is located in a novel, full- length 6.9- kb muscle cDNA; they designated the corresponding protein dysferlin.

[17676] Animal model experiments lend further support to the function of DYSF. The SJL mouse strain (Festing, 1979) is susceptible to many induced autoimmune diseases such as experimental autoimmune encephalitis (EAE) and inflammatory muscle disease. Additionally, the skeletal muscle of SJL mice was shown to have an increased regenerative capacity and demonstrates the spontaneous occurrence of what was designated an 'inflammatory myopathy,' accompanied by loss of strength. By histopathologic examinations of muscles in SJL mice of different ages, Bittner et al. (1999) found features compatible with a progressive muscular dystrophy, including degenerative and regenerative changes of muscle fibers and a progressive fibrosis. Histologically, the changes were observed in mice as young as 3 weeks of age. Changes affected pri-

marily the proximal muscle groups, whereas the distal muscles remained less affected. The morphologic alterations were associated with signs of slowly progressive muscle weakness, which Bittner et al. (1999) detected as early as 3 weeks after birth when mice were suspended by their tails. The phenotype was found to be inherited as an autosomal recessive trait and was found to map to mouse chromosome 6, in a region syntenic with human 2p13, where the DYSF gene maps. Because of this synteny, Bittner et al. (1999) studied dysferlin in these mice. They found a reduction to approximately 15% of control levels in SJL mice. They found a 171- bp deletion in the Dysf gene of SJL mice, predicted to result in removal of 57 amino acids, including most of the fourth C2 domain. The last C2 domain is conserved in other members of the fer-like gene family.

[17677] It is appreciated that the abovementioned animal model for DYSF is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17678] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17679] Bittner, R. E.; Anderson, L. V. B.; Burkhardt, E.; Bashir, R.; Vafiadaki, E.; Ivanova, S.; Raffelsberger, T.; Maerk, I.; Hoger, H.; Jung, M.; Karbasiyan, M.; Storch, M.; Lassmann, H.; Moss, J. A.; Davison, K.; Harrison, R.; Bushby, K. M. D.; Reis, A. : Dysferlin deletion in SJL mice (SJL- Dysf) defines a natural model for limb girdle muscular dystrophy 2B. (Letter) Nature Genet. 23: 141- 142, 1999. ; and

[17680] Liu, J.; Wu, C.; Bossie, K.; Bejaoui, K.; Hosler, B. A.; Gingrich, J. C.; Ben Hamida, M.; Hentati, F.; Schurr, E.; de Jong, P. J.; Brown, R. H., Jr. : Generation of 3- Mb PAC contig sp.

[17681] Further studies establishing the function and utilities of DYSF are found in John Hopkins OMIM database record ID 603009, and in cited publications listed in Table 5, which are hereby incorporated by reference.EFG2 (Accession NP_733792.1) is another GAM100 target gene, herein designated TARGET GENE. EFG2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EFG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EFG2 BINDING SITE, designated SEQ ID:14944, to the nucleotide

sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17682] Another function of GAM100 is therefore inhibition of EFG2 (Accession NP_733792.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFG2.

[17683] EFG2 (Accession NP_115756.2) is another GAM100 target gene, herein designated TARGET GENE. EFG2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EFG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EFG2 BINDING SITE, designated SEQ ID:14944, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17684] Another function of GAM100 is therefore inhibition of EFG2 (Accession NP_115756.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFG2.

[17685] Enabled homolog (drosophila) (ENAH, Accession NP_060682.1) is another GAM100 target gene, herein designated TARGET GENE. ENAH BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by ENAH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ENAH BINDING SITE, designated SEQ ID:12776, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17686] Another function of GAM100 is therefore inhibition of Enabled homolog (drosophila) (ENAH, Accession NP_060682.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENAH.

[17687] Fatty-acid-coenzyme a ligase, long-chain 1 (FACL1, Accession NP_001986.1) is another GAM100 target gene, herein designated TARGET GENE. FACL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FACL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FACL1 BINDING SITE, designated SEQ ID:20169, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:243.

[17688] Another function of GAM100 is therefore inhibition of Fatty-acid-coenzyme a ligase, long-chain 1 (FACL1, Accession NP_001986.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL1.

[17689] FLJ20303 (Accession NP_060225.2) is another GAM100 target gene, herein designated TARGET GENE. FLJ20303 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20303, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20303 BINDING SITE, designated SEQ ID:16995, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17690] Another function of GAM100 is therefore inhibition of FLJ20303 (Accession NP_060225.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20303.

[17691] FLJ23834 (Accession NP_689963.1) is another GAM100 target gene, herein designated TARGET GENE. FLJ23834

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ23834, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23834 BINDING SITE, designated SEQ ID:2419, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17692] Another function of GAM100 is therefore inhibition of FLJ23834 (Accession NP_689963.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23834.

[17693] FLJ32894 (Accession NP_653268.1) is another GAM100 target gene, herein designated TARGET GENE. FLJ32894 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32894, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32894 BINDING SITE, designated SEQ ID:3993, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17694] Another function of GAM100 is therefore inhibition of FLJ32894 (Accession NP_653268.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32894.

[17695] FLJ33768 (Accession NP_775881.1) is another GAM100 target gene, herein designated TARGET GENE. FLJ33768 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ33768, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ33768 BINDING SITE, designated SEQ ID:4332, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17696] Another function of GAM100 is therefore inhibition of FLJ33768 (Accession NP_775881.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33768.

[17697] FLJ34922 (Accession NP_689483.1) is another GAM100 target gene, herein designated TARGET GENE. FLJ34922 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ34922, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34922 BINDING SITE, designated SEQ ID:14134, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17698] Another function of GAM100 is therefore inhibition of FLJ34922 (Accession NP_689483.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34922.

[17699] FLJ39106 (Accession NP_775900.1) is another GAM100 target gene, herein designated TARGET GENE. FLJ39106 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39106, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39106 BINDING SITE, designated SEQ ID:12417, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17700] Another function of GAM100 is therefore inhibition of

FLJ39106 (Accession NP_775900.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39106.

[17701] FLJ90430 (Accession NP_848653.1) is another GAM100 target gene, herein designated TARGET GENE. FLJ90430 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ90430, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ90430 BINDING SITE, designated SEQ ID:14531, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17702] Another function of GAM100 is therefore inhibition of FLJ90430 (Accession NP_848653.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ90430.

[17703] GCC185 (Accession NP_852118.1) is another GAM100 target gene, herein designated TARGET GENE. GCC185 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by

GCC185, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GCC185 BINDING SITE, designated SEQ ID:18198, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17704] Another function of GAM100 is therefore inhibition of GCC185 (Accession NP_852118.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCC185.

[17705] GCC185 (Accession NP_055450.1) is another GAM100 target gene, herein designated TARGET GENE. GCC185 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GCC185, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GCC185 BINDING SITE, designated SEQ ID:18198, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17706] Another function of GAM100 is therefore inhibition of GCC185 (Accession NP_055450.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCC185.

[17707] Gephyrin (GPHN, Accession NP_065857.1) is another GAM100 target gene, herein designated TARGET GENE. GPHN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPHN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPHN BINDING SITE, designated SEQ ID:6063, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17708] Another function of GAM100 is therefore inhibition of Gephyrin (GPHN, Accession NP_065857.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPHN.

[17709] Interleukin 5 (colony-stimulating factor, eosinophil) (IL5, Accession NP_000870.1) is another GAM100 target gene, herein designated TARGET GENE. IL5 BINDING SITE is a

target binding site found in the 3` untranslated region of mRNA encoded by IL5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL5 BINDING SITE, designated SEQ ID:16606, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17710] Another function of GAM100 is therefore inhibition of Interleukin 5 (colony-stimulating factor, eosinophil) (IL5, Accession NP_000870.1), a gene which induces terminal differentiation of late- developing b- cells to immunoglobulin secreting cells. and therefore may be associated with 5q- syndrome. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of 5q- syndrome, and of other diseases and clinical conditions associated with IL5.

[17711] The function of IL5 has been established by previous studies. Campbell et al. (1987) cloned eosinophil differentiation factor (EDF) from a genomic library in lambda phage by using a murine EDF cDNA clone as a probe. The human gene contains 3 introns. The predicted amino acid sequence of 134 amino acids was identical to that re-

ported for human interleukin- 5 but showed no significant homology with other known hematopoietic growth regulators. Interleukin- 5 is a selective eosinophil- activating growth hormone. The amino acid sequence was about 70% identical to that of murine EDF. Recombinant human EDF, expressed from the human EDF gene after transfection into monkey COS cells, stimulated the production of eosinophils and eosinophil colonies from normal human bone marrow but had no effect on the production of neutrophils or mononuclear cells (monocytes and lymphoid cells). Tanabe et al. (1987) cloned the IL5 gene and determined its structure. Yokota et al. (1987) concluded that a single cDNA clone encodes a protein that acts as a growth and differentiation factor for both B cells and eosinophils By analysis of human YAC transgenic mice containing the 5q31 cytokine genes, Lacy et al. (2000) determined that the human proteins are produced under Th2 conditions in vitro and in response to Nippostrongylus brasiliensis, a Th2- inducing stimulus, in vivo. The authors observed no adverse effects on murine lymphoid organs. Fewer cells produced the endogenous mouse cytokines in transgenic than in control mice, suggesting competition for stable expression between the mouse and human genes. The

data also suggested that regulatory elements within the human transgene are capable of interacting with trans-acting murine factors

[17712]

[17713] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17714] Loots, G. G.; Locksley, R. M.; Blankespoor, C. M.; Wang, Z. E.; Miller, W.; Rubin, E. M.; Frazer, K. A. : Identification of a coordinate regulator of interleukins 4, 13, and 5 by cross-species sequence comparisons. Science 288: 136- 140, 2000. ; and

[17715] Lacy, D. A.; Wang, Z.- E.; Symula, D. J.; McArthur, C. J.; Rubin, E. M.; Frazer, K. A.; Locksley, R. M. : Faithful expression of the human 5q31 cytokine cluster in transgenic mice. J. Im.

[17716] Further studies establishing the function and utilities of IL5 are found in John Hopkins OMIM database record ID 147850, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interphotoreceptor matrix proteoglycan 1 (IMPG1, Accession NP_001554.2) is another GAM100 target gene, herein designated TARGET GENE. IMPG1 BINDING SITE is a target binding site found

in the 3` untranslated region of mRNA encoded by IMPG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IMPG1 BINDING SITE, designated SEQ ID:5063, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17717] Another function of GAM100 is therefore inhibition of Interphotoreceptor matrix proteoglycan 1 (IMPG1, Accession NP_001554.2), a gene which Interphotoreceptor matrix proteoglycan 1; extracellular matrix protein and therefore may be associated with Autosomal dominant stargardt-like macular dystrophies. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of Autosomal dominant stargardt- like macular dystrophies, and of other diseases and clinical conditions associated with IMPG1.

[17718] The function of IMPG1 has been established by previous studies. Interphotoreceptor matrix glycoconjugates, which are largely proteoglycans, appear to participate in retinal adhesion and in maintaining photoreceptor viability. Kuehn and Hageman (1995) isolated monkey interphotoreceptor matrix proteoglycan- 1 (Impg1), which the au-

thors designated IPM- 150, from an SDS- polyacrylamide gel and utilized amino acid sequence data from the isolated protein to design RT- PCR primers for amplification of monkey retinal mRNA. They used the resulting clone to screen a human cDNA library and isolated an 809- bp cDNA, which shares 97% homology with the monkey sequence and encodes human IMPG1. The putative protein, a chondroitin 6- sulfate proteoglycan, contains 4 consensus sequences for hyaluronan binding and 3 for N- glycosylation, as well as several potential O- glycosylation sites. To assess the role of the IMPG1 gene in human retinal dystrophies, Felbor et al. (1998) determined its genomic organization and chromosomal location. It is composed of 17 exons ranging from 21 to 533 bp, including an alternatively spliced exon 2. Using somatic cell hybrid mapping and fluorescence in situ hybridization analysis, they assigned the IMPG1 locus to 6q13- q15. This interval overlaps with the chromosomal localization of several human retinopathies, including autosomal dominant Stargardt- like macular dystrophy (STGD3; 600110), progressive bifocal chorioretinal atrophy (PBCRA; 600790), and North Carolina macular dystrophy (MCDR1; 136550). Thus, IMPG1 represents an attractive candidate for these

6q- linked disorders. Gehrig et al. (1998) found no disease- associated mutations in the IMPG1 gene in a single patient from an autosomal dominant STGD family or in patients from 6q- linked multigenerational families diagnosed with PBCRA or MCDR1.

[17719]

[17720] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17721] Felbor, U.; Gehrig, A.; Sauer, C. G.; Marquardt, A.; Kohler, M.; Schmid, M.; Weber, B. H. F. : Genomic organization and chromosomal localization of the interphotoreceptor matrix proteoglycan- 1 (IMPG1) gene: a candidate for 6q- linked retinopathies. Cytogenet. Cell Genet. 81: 12- 17, 1998. ; and

[17722] Gehrig, A.; Felbor, U.; Kelsell, R. E.; Hunt, D. M.; Maumenee, I. H.; Weber, B. H. F. : Assessment of the interphotoreceptor matrix proteoglycan- 1 (IMPG1) gene localised to 6q13- q15 in a.

[17723] Further studies establishing the function and utilities of IMPG1 are found in John Hopkins OMIM database record ID 602870, and in cited publications listed in Table 5, which are hereby incorporated by reference.Inositol

1,4,5-triphosphate receptor, type 2 (ITPR2, Accession NP_002214.1) is another GAM100 target gene, herein designated TARGET GENE. ITPR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITPR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITPR2 BINDING SITE, designated SEQ ID:4278, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17724] Another function of GAM100 is therefore inhibition of Inositol 1,4,5-triphosphate receptor, type 2 (ITPR2, Accession NP_002214.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR2.

[17725] JUB (Accession NP_116265.1) is another GAM100 target gene, herein designated TARGET GENE. JUB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by JUB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JUB BINDING SITE, designated SEQ ID:17497, to the nucleotide se-

quence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17726] Another function of GAM100 is therefore inhibition of JUB (Accession NP_116265.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JUB.

[17727] KIAA0391 (Accession NP_055487.1) is another GAM100 target gene, herein designated TARGET GENE. KIAA0391 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0391, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:8518, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17728] Another function of GAM100 is therefore inhibition of KIAA0391 (Accession NP_055487.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0391.

[17729] KIAA0738 (Accession NP_055534.1) is another GAM100 target gene, herein designated TARGET GENE. KIAA0738

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0738, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0738 BINDING SITE, designated SEQ ID:17995, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17730] Another function of GAM100 is therefore inhibition of KIAA0738 (Accession NP_055534.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0738.

[17731] KIAA1495 (Accession NP_065922.1) is another GAM100 target gene, herein designated TARGET GENE. KIAA1495 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1495, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1495 BINDING SITE, designated SEQ ID:17775, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17732] Another function of GAM100 is therefore inhibition of KIAA1495 (Accession NP_065922.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1495.

[17733] KIAA2024 (Accession NP_742067.1) is another GAM100 target gene, herein designated TARGET GENE. KIAA2024 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA2024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA2024 BINDING SITE, designated SEQ ID:18881, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17734] Another function of GAM100 is therefore inhibition of KIAA2024 (Accession NP_742067.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA2024.

[17735] Lamin b receptor (LBR, Accession NP_002287.1) is another GAM100 target gene, herein designated TARGET GENE. LBR BINDING SITE is a target binding site found in the 3`

untranslated region of mRNA encoded by LBR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LBR BINDING SITE, designated SEQ ID:14697, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17736] Another function of GAM100 is therefore inhibition of Lamin b receptor (LBR, Accession NP_002287.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBR.

[17737] LGN (Accession NP_037428.2) is another GAM100 target gene, herein designated TARGET GENE. LGN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LGN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LGN BINDING SITE, designated SEQ ID:6174, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17738] Another function of GAM100 is therefore inhibition of LGN

(Accession NP_037428.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGN.

[17739] LOC113521 (Accession NP_660283.1) is another GAM100 target gene, herein designated TARGET GENE. LOC113521 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC113521, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC113521 BINDING SITE, designated SEQ ID:1372, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17740] Another function of GAM100 is therefore inhibition of LOC113521 (Accession NP_660283.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113521.

[17741] LOC123722 (Accession XP_058721.2) is another GAM100 target gene, herein designated TARGET GENE. LOC123722 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC123722, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC123722 BINDING SITE, designated SEQ ID:15605, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17742] Another function of GAM100 is therefore inhibition of LOC123722 (Accession XP_058721.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123722.

[17743] LOC126536 (Accession XP_059054.1) is another GAM100 target gene, herein designated TARGET GENE. LOC126536 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126536, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126536 BINDING SITE, designated SEQ ID:13459, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17744] Another function of GAM100 is therefore inhibition of LOC126536 (Accession XP_059054.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC126536.

[17745] LOC126669 (Accession XP_060121.4) is another GAM100 target gene, herein designated TARGET GENE. LOC126669 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126669, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126669 BINDING SITE, designated SEQ ID:18742, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17746] Another function of GAM100 is therefore inhibition of LOC126669 (Accession XP_060121.4) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126669.

[17747] LOC131368 (Accession NP_778226.1) is another GAM100 target gene, herein designated TARGET GENE. LOC131368 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC131368, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC131368 BINDING SITE, designated SEQ ID:14040, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17748] Another function of GAM100 is therefore inhibition of LOC131368 (Accession NP_778226.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131368.

[17749] LOC150868 (Accession XP_087028.1) is another GAM100 target gene, herein designated TARGET GENE. LOC150868 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150868, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150868 BINDING SITE, designated SEQ ID:8784, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17750] Another function of GAM100 is therefore inhibition of LOC150868 (Accession XP_087028.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC150868.

[17751] LOC151512 (Accession XP_098072.2) is another GAM100 target gene, herein designated TARGET GENE. LOC151512 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151512, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151512 BINDING SITE, designated SEQ ID:453, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17752] Another function of GAM100 is therefore inhibition of LOC151512 (Accession XP_098072.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151512.

[17753] LOC153139 (Accession XP_098318.1) is another GAM100 target gene, herein designated TARGET GENE. LOC153139 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC153139, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC153139 BINDING SITE, designated SEQ ID:7609, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17754] Another function of GAM100 is therefore inhibition of LOC153139 (Accession XP_098318.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153139.

[17755] LOC154184 (Accession XP_098488.2) is another GAM100 target gene, herein designated TARGET GENE. LOC154184 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC154184, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154184 BINDING SITE, designated SEQ ID:7609, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17756] Another function of GAM100 is therefore inhibition of LOC154184 (Accession XP_098488.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154184.

[17757] LOC158450 (Accession XP_088580.1) is another GAM100 target gene, herein designated TARGET GENE. LOC158450 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158450, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158450 BINDING SITE, designated SEQ ID:1108, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17758] Another function of GAM100 is therefore inhibition of LOC158450 (Accession XP_088580.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158450.

[17759] LOC158927 (Accession XP_099004.1) is another GAM100 target gene, herein designated TARGET GENE. LOC158927 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158927, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158927 BINDING SITE, designated SEQ ID:3321, to

the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17760] Another function of GAM100 is therefore inhibition of LOC158927 (Accession XP_099004.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158927.

[17761] LOC163404 (Accession XP_088864.3) is another GAM100 target gene, herein designated TARGET GENE. LOC163404 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC163404, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC163404 BINDING SITE, designated SEQ ID:6012, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17762] Another function of GAM100 is therefore inhibition of LOC163404 (Accession XP_088864.3) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163404.

[17763] LOC196996 (Accession XP_113796.1) is another GAM100

target gene, herein designated TARGET GENE. LOC196996 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196996, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196996 BINDING SITE, designated SEQ ID:7822, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17764] Another function of GAM100 is therefore inhibition of LOC196996 (Accession XP_113796.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196996.

[17765] LOC221981 (Accession XP_168344.1) is another GAM100 target gene, herein designated TARGET GENE. LOC221981 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221981, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221981 BINDING SITE, designated SEQ ID:14341, to the nucleotide sequence of GAM100 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:243.

[17766] Another function of GAM100 is therefore inhibition of LOC221981 (Accession XP_168344.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221981.

[17767] LOC222159 (Accession XP_168421.2) is another GAM100 target gene, herein designated TARGET GENE. LOC222159 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by LOC222159, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222159 BINDING SITE, designated SEQ ID:3184, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17768] Another function of GAM100 is therefore inhibition of LOC222159 (Accession XP_168421.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222159.

[17769] LOC255045 (Accession XP_171243.2) is another GAM100

target gene, herein designated TARGET GENE. LOC255045 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255045 BINDING SITE, designated SEQ ID:15757, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17770] Another function of GAM100 is therefore inhibition of LOC255045 (Accession XP_171243.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255045.

[17771] LOC283075 (Accession XP_208500.1) is another GAM100 target gene, herein designated TARGET GENE. LOC283075 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283075, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283075 BINDING SITE, designated SEQ ID:11284, to the nucleotide sequence of GAM100 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:243.

[17772] Another function of GAM100 is therefore inhibition of LOC283075 (Accession XP_208500.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283075.

[17773] LOC283435 (Accession XP_211035.1) is another GAM100 target gene, herein designated TARGET GENE. LOC283435 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283435, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283435 BINDING SITE, designated SEQ ID:3292, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17774] Another function of GAM100 is therefore inhibition of LOC283435 (Accession XP_211035.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283435.

[17775] LOC283484 (Accession XP_211053.1) is another GAM100 target gene, herein designated TARGET GENE. LOC283484

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283484, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283484 BINDING SITE, designated SEQ ID:9750, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17776] Another function of GAM100 is therefore inhibition of LOC283484 (Accession XP_211053.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283484.

[17777] LOC283665 (Accession XP_211143.1) is another GAM100 target gene, herein designated TARGET GENE. LOC283665 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283665, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283665 BINDING SITE, designated SEQ ID:12992, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17778] Another function of GAM100 is therefore inhibition of LOC283665 (Accession XP_211143.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283665.

[17779] LOC283690 (Accession XP_211167.1) is another GAM100 target gene, herein designated TARGET GENE. LOC283690 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283690, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283690 BINDING SITE, designated SEQ ID:2565, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17780] Another function of GAM100 is therefore inhibition of LOC283690 (Accession XP_211167.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283690.

[17781] LOC283810 (Accession XP_208853.1) is another GAM100 target gene, herein designated TARGET GENE. LOC283810 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC283810, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283810 BINDING SITE, designated SEQ ID:12634, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17782] Another function of GAM100 is therefore inhibition of LOC283810 (Accession XP_208853.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283810.

[17783] LOC284166 (Accession XP_209050.1) is another GAM100 target gene, herein designated TARGET GENE. LOC284166 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284166, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284166 BINDING SITE, designated SEQ ID:16685, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17784] Another function of GAM100 is therefore inhibition of

LOC284166 (Accession XP_209050.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284166.

[17785] LOC284304 (Accession XP_211426.1) is another GAM100 target gene, herein designated TARGET GENE. LOC284304 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284304, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284304 BINDING SITE, designated SEQ ID:5700, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17786] Another function of GAM100 is therefore inhibition of LOC284304 (Accession XP_211426.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284304.

[17787] LOC284925 (Accession XP_209414.1) is another GAM100 target gene, herein designated TARGET GENE. LOC284925 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284925, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284925 BINDING SITE, designated SEQ ID:1198, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17788] Another function of GAM100 is therefore inhibition of LOC284925 (Accession XP_209414.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284925.

[17789] LOC285190 (Accession XP_208296.1) is another GAM100 target gene, herein designated TARGET GENE. LOC285190 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285190, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285190 BINDING SITE, designated SEQ ID:18198, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17790] Another function of GAM100 is therefore inhibition of LOC285190 (Accession XP_208296.1) . Accordingly, utili-

ties of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285190.

[17791] LOC285229 (Accession XP_211812.1) is another GAM100 target gene, herein designated TARGET GENE. LOC285229 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285229, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285229 BINDING SITE, designated SEQ ID:12704, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17792] Another function of GAM100 is therefore inhibition of LOC285229 (Accession XP_211812.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285229.

[17793] LOC285726 (Accession XP_211998.1) is another GAM100 target gene, herein designated TARGET GENE. LOC285726 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285726, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285726 BINDING SITE, designated SEQ ID:3743, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17794] Another function of GAM100 is therefore inhibition of LOC285726 (Accession XP_211998.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285726.

[17795] LOC285749 (Accession XP_212010.1) is another GAM100 target gene, herein designated TARGET GENE. LOC285749 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285749, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285749 BINDING SITE, designated SEQ ID:7609, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17796] Another function of GAM100 is therefore inhibition of LOC285749 (Accession XP_212010.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC285749.

[17797] LOC338558 (Accession XP_290465.1) is another GAM100 target gene, herein designated TARGET GENE. LOC338558 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338558, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338558 BINDING SITE, designated SEQ ID:16649, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17798] Another function of GAM100 is therefore inhibition of LOC338558 (Accession XP_290465.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338558.

[17799] LOC339512 (Accession XP_290935.1) is another GAM100 target gene, herein designated TARGET GENE. LOC339512 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339512, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC339512 BINDING SITE, designated SEQ ID:14625, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17800] Another function of GAM100 is therefore inhibition of LOC339512 (Accession XP_290935.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339512.

[17801] LOC340138 (Accession XP_291153.1) is another GAM100 target gene, herein designated TARGET GENE. LOC340138 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340138, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340138 BINDING SITE, designated SEQ ID:15795, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17802] Another function of GAM100 is therefore inhibition of LOC340138 (Accession XP_291153.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC340138.

[17803] LOC340252 (Accession XP_291212.1) is another GAM100 target gene, herein designated TARGET GENE. LOC340252 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340252, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340252 BINDING SITE, designated SEQ ID:14531, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17804] Another function of GAM100 is therefore inhibition of LOC340252 (Accession XP_291212.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340252.

[17805] LOC340452 (Accession XP_291294.1) is another GAM100 target gene, herein designated TARGET GENE. LOC340452 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340452, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC340452 BINDING SITE, designated SEQ ID:6289, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17806] Another function of GAM100 is therefore inhibition of LOC340452 (Accession XP_291294.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340452.

[17807] LOC348235 (Accession XP_300670.1) is another GAM100 target gene, herein designated TARGET GENE. LOC348235 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348235, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348235 BINDING SITE, designated SEQ ID:6032, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17808] Another function of GAM100 is therefore inhibition of LOC348235 (Accession XP_300670.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348235.

[17809] LOC348290 (Accession XP_302713.1) is another GAM100 target gene, herein designated TARGET GENE. LOC348290 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348290, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348290 BINDING SITE, designated SEQ ID:6749, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17810] Another function of GAM100 is therefore inhibition of LOC348290 (Accession XP_302713.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348290.

[17811] LOC348396 (Accession XP_300729.1) is another GAM100 target gene, herein designated TARGET GENE. LOC348396 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348396, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348396 BINDING SITE, designated SEQ ID:10842, to

the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17812] Another function of GAM100 is therefore inhibition of LOC348396 (Accession XP_300729.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348396.

[17813] LOC348655 (Accession XP_300391.1) is another GAM100 target gene, herein designated TARGET GENE. LOC348655 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348655, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348655 BINDING SITE, designated SEQ ID:3869, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17814] Another function of GAM100 is therefore inhibition of LOC348655 (Accession XP_300391.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348655.

[17815] LOC348705 (Accession XP_300396.1) is another GAM100

target gene, herein designated TARGET GENE. LOC348705 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348705, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348705 BINDING SITE, designated SEQ ID:13038, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17816] Another function of GAM100 is therefore inhibition of LOC348705 (Accession XP_300396.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348705.

[17817] LOC348749 (Accession XP_302880.1) is another GAM100 target gene, herein designated TARGET GENE. LOC348749 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348749, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348749 BINDING SITE, designated SEQ ID:10545, to the nucleotide sequence of GAM100 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:243.

[17818] Another function of GAM100 is therefore inhibition of LOC348749 (Accession XP_302880.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348749.

[17819] LOC51336 (Accession NP_057730.1) is another GAM100 target gene, herein designated TARGET GENE. LOC51336 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC51336, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51336 BINDING SITE, designated SEQ ID:16981, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17820] Another function of GAM100 is therefore inhibition of LOC51336 (Accession NP_057730.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51336.

[17821] LOC57086 (Accession NP_065084.1) is another GAM100 target gene, herein designated TARGET GENE. LOC57086

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC57086, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC57086 BINDING SITE, designated SEQ ID:15672, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17822] Another function of GAM100 is therefore inhibition of LOC57086 (Accession NP_065084.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57086.

[17823] LOC92606 (Accession XP_046097.1) is another GAM100 target gene, herein designated TARGET GENE. LOC92606 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92606, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92606 BINDING SITE, designated SEQ ID:20066, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17824] Another function of GAM100 is therefore inhibition of LOC92606 (Accession XP_046097.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92606.

[17825] Lecithin retinol acyltransferase (phosphatidylcholine--retinol o-acyltransferase) (LRAT, Accession NP_004735.1) is another GAM100 target gene, herein designated TARGET GENE. LRAT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LRAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LRAT BINDING SITE, designated SEQ ID:7406, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17826] Another function of GAM100 is therefore inhibition of Lecithin retinol acyltransferase (phosphatidylcholine--retinol o-acyltransferase) (LRAT, Accession NP_004735.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRAT.

[17827] Mad, mothers against decapentaplegic homolog 4 (drosophila) (MADH4, Accession NP_005350.1) is another GAM100 target gene, herein designated TARGET GENE. MADH4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MADH4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MADH4 BINDING SITE, designated SEQ ID:7427, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17828] Another function of GAM100 is therefore inhibition of Mad, mothers against decapentaplegic homolog 4 (drosophila) (MADH4, Accession NP_005350.1), a gene which common mediator of signal transduction by tgf-beta (transforming growth factor) superfamily; smad4 is the common smad (co- smad). promotes binding of the smad2/smad4/fast- 1 complex to dna and provides an activation function required for smad1 or smad2 to stimulate transcription. may act as a tumor suppressor. and therefore is associated with Pancreatic carcinoma. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of Pancreatic carcinoma., and of other dis-

eases and clinical conditions associated with MADH4.

[17829] The function of MADH4 has been established by previous studies. About 90% of human pancreatic carcinomas show allelic loss at 18q. Hahn et al. (1996) reported the identification of a putative tumor suppressor gene on chromosome 18q21.1 that may be a candidate for pancreatic carcinoma. The gene was homozygously deleted in 25 of 84 tumors and mutations were identified as somatic mutations in 6 of 27 carcinomas that lacked deletions. The gene was localized by deletion analysis of xenograft DNA. Markers absent in these samples were used to screen the CEPH mega- YAC library. YACs spanning the minimal deletion region were subcloned as cosmids for sequencing and recovery of cDNAs. A 2,680- bp cDNA was found and shown to code for a predicted 552- amino acid protein. The predicted protein shares blocks of as much as 85% similarity to the Drosophila Mad protein and the Caenorhabditis elegans sma- 2,- 3 and - 4 proteins. In Drosophila, homozygous Mad mutants exhibit a variety of developmental defects. The authors showed that the human gene contains 11 exons. Hahn et al. (1996) designated the gene DPC4 (for homozygously deleted in pancreatic carcinoma, locus 4). This region of chromosome

18q also contains a gene (DCC; 120470) found to be deleted in colorectal cancers.

[17830] Animal model experiments lend further support to the function of MADH4. Takaku et al. (1998) inactivated the mouse Dpc4 (Smad4) homolog. The homozygous mutants were embryonic lethal, whereas the heterozygotes showed no abnormality. The investigators then introduced the Dpc4 mutation into the knockout mice for the mouse homolog of the human APC (OMIM Ref. No. 175100) gene, Apc- delta716, a model for human familial adenomatous polyposis. Because both Apc and Dpc4 are located on mouse chromosome 18, they constructed compound heterozygotes carrying both mutations on the same chromosome by meiotic recombination. In such mice, intestinal polyps developed into more malignant tumors than those in the simple Apc- delta716 heterozygotes, showing an extensive stromal cell proliferation, submucosal invasion, cell type heterogeneity, and in vivo transplantability. Takaku et al. (1998) suggested that mutations in DPC4 play a significant role in the malignant progression of colorectal tumors. Sirard et al. (1998) demonstrated that homozygous Smad4 mutant mice died before embryonic day 7.5. Mutant embryos have reduced size, fail to gastrulate

or express a mesodermal marker, and show abnormal visceral endoderm development. Growth retardation of the Smad4- deficient embryos results from reduced cell proliferation rather than increased apoptosis. Aggregation of mutant Smad4 embryonic stem cells with wildtype tetraploid morulae rescued the gastrulation defect. The results of Sirard et al. (1998) indicated that Smad4 is initially required for the differentiation of the visceral endoderm and that the gastrulation defect in the epiblast is secondary and noncell autonomous. Rescued embryos showed severe anterior truncations, indicating a second important role for Smad4 in anterior patterning during embryogenesis

[17831] It is appreciated that the abovementioned animal model for MADH4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17832] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17833] Sirard, C.; de la Pompa, J. L.; Elia, A.; Itie, A.; Mirtsos, C.; Cheung, A.; Hahn, S.; Wakeham, A.; Schwartz, L.; Kern, S. E.; Rossant, J.; Mak, T. W. : The tumor suppressor gene

Smad4/Dpc4 is required for gastrulation and later for anterior development of the mouse embryo. Genes Dev. 12: 107- 119, 1998. ; and

[17834] Hahn, S. A.; Schutte, M.; Hoque, T. M. S.; Moskaluk, C. A.; da Costa, L. T.; Rozenblum, E.; Weinstein, C. L.; Fischer, A.; Yeo, C. J.; Hruban, R. H.; Kern, S. E. : DPC4, a candidate tumor s.

[17835] Further studies establishing the function and utilities of MADH4 are found in John Hopkins OMIM database record ID 600993, and in cited publications listed in Table 5, which are hereby incorporated by reference.Microtubule-associated protein 2 (MAP2, Accession NP_002365.2) is another GAM100 target gene, herein designated TARGET GENE. MAP2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MAP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAP2 BINDING SITE, designated SEQ ID:3835, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17836] Another function of GAM100 is therefore inhibition of Mi-

crotubule-associated protein 2 (MAP2, Accession NP_002365.2), a gene which may act in stabilizing microtubules against depolymerization.also seems to have a stiffening effect on microtubules. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2.

[17837] The function of MAP2 has been established by previous studies. For nerve cells to develop their highly polarized form, appropriate structural molecules must be targeted to either axons or dendrites. This could be achieved by the synthesis of structural proteins in the cell body and their sorting to either axons or dendrites by specific transport mechanisms. For dendrites, an alternative possibility is that proteins could be synthesized locally in the dendritic cytoplasm. This would allow regulation of the production of structural molecules in response to local demand during dendritic development. The existence of dendritic polyribosomes and the demonstration that newly synthesized RNA is transported into the dendrites of neurons differentiating in culture support the feasibility of dendritic protein synthesis. By in situ hybridization with specific cDNA probes, Garner et al. (1988) showed that mRNA for the dendrite- specific microtubule- associated

protein MAP2 was present in dendrites in the developing brain. By contrast, the mRNA for tubulin (OMIM Ref. No. 191120), a protein present in both axons and dendrites, was localized exclusively in neuronal cell bodies

[17838] Animal model experiments lend further support to the function of MAP2. Marsden et al. (1996) produced transgenic mice that overexpress embryonic Map2 (referred to by them as MAP2c) without inducing detectable effects on the morphology of neurons. The transgenic MAP2c was present in dendrites but not in axons but transgenic MAP2c messenger RNA was limited to cell bodies. The authors concluded that dendritic localization of transgenic MAP2c protein was not the result of previous transport of its mRNA but implies the existence of a protein- based mechanism capable of sorting MAP2 protein isoforms

[17839] It is appreciated that the abovementioned animal model for MAP2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17840] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17841] Garner, C. C.; Tucker, R. P.; Matus, A. : Selective localiza-

tion of messenger RNA for cytoskeletal protein MAP2 in dendrites. Nature 336: 674- 677, 1988. ; and

[17867] Further studies establishing the function and utilities of MAP2 are found in John Hopkins OMIM database record ID 157130, and in cited publications listed in Table 5, which are hereby incorporated by reference.Methylcrotonoyl-coenzyme a carboxylase 1 (alpha) (MCCC1, Accession NP_064551.2) is another GAM100 target gene, herein designated TARGET GENE. MCCC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MCCC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCCC1 BINDING SITE, designated SEQ ID:16428, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17868] Another function of GAM100 is therefore inhibition of Methylcrotonoyl-coenzyme a carboxylase 1 (alpha) (MCCC1, Accession NP_064551.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MCCC1.

[17869] MDS024 (Accession NP_068592.1) is another GAM100 target gene, herein designated TARGET GENE. MDS024 BINDING SITE1 and MDS024 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by MDS024, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MDS024 BINDING SITE1 and MDS024 BINDING SITE2, designated SEQ ID:10207 and SEQ ID:7227 respectively, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17870] Another function of GAM100 is therefore inhibition of MDS024 (Accession NP_068592.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDS024.

[17871] MGC34079 (Accession NP_689688.1) is another GAM100 target gene, herein designated TARGET GENE. MGC34079 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC34079, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC34079 BINDING SITE, designated SEQ ID:13369, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17872] Another function of GAM100 is therefore inhibition of MGC34079 (Accession NP_689688.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC34079.

[17873] MGC48998 (Accession NP_848645.1) is another GAM100 target gene, herein designated TARGET GENE. MGC48998 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC48998, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC48998 BINDING SITE, designated SEQ ID:14625, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17874] Another function of GAM100 is therefore inhibition of MGC48998 (Accession NP_848645.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC48998.

[17875] Neuronal pentraxin i (NPTX1, Accession NP_002513.1) is another GAM100 target gene, herein designated TARGET GENE. NPTX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NPTX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPTX1 BINDING SITE, designated SEQ ID:9030, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17876] Another function of GAM100 is therefore inhibition of Neuronal pentraxin i (NPTX1, Accession NP_002513.1), a gene which may be involved in synaptic uptake of extracellular material and is very strongly similar to rat NP1. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTX1.

[17877] The function of NPTX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM48.2.Nucleoporin 214kda (NUP214, Accession

NP_005076.2) is another GAM100 target gene, herein designated TARGET GENE. NUP214 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NUP214, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUP214 BINDING SITE, designated SEQ ID:18578, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17878] Another function of GAM100 is therefore inhibition of Nucleoporin 214kda (NUP214, Accession NP_005076.2), a gene which mediates nucleocytoplasmic transport. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP214.

[17879] The function of NUP214 has been established by previous studies. The CAN gene on human 9q34 forms a fusion gene with the DEK (OMIM Ref. No. 125264) gene at 6p23 in a subset of acute myeloid leukemia (acute nonlymphocytic leukemia) carrying a t(6;9)(p23;q34) translocation. Von Lindern et al. (1990) estimated that the CAN gene lies 360 kb distal to ABL (OMIM Ref. No. 189980). The break-

points in the translocations were clustered in an 8- kb intron of a gene encoding a 7.5- kb transcript. The gene was called Cain (symbol, CAN), presumably for 'cancer intron on nine.' The gene measured more than 65 kb and was transcribed 5- prime centromeric- to- 3- prime telomeric on the chromosome . It is the 3- prime portion of the CAN gene that participates in the fusion gene in the leukemogenic translocation t(6;9).

[17880] Animal model experiments lend further support to the function of NUP214. Van Deursen et al. (1996) created Can- /- knockout mice by targeted disruption and embryonic stem (ES) cell technology. No Can- /- knockout mice were identified in heterozygous crosses, demonstrating that Can is essential for embryonic development. Lethality occurs between 4.0- 4.5 days postcoitum, after the depletion of maternal Can sources. Homozygous Can- /- ES cells are not viable. In 3.5- day- old mutant embryos, cultured in vitro, progressive depletion of Can leads to cell cycle arrest in G2 phase, and eventually to blastocele collapse, impaired NLS- mediated protein uptake, and nuclear accumulation of polyadenylated RNA. The defective Can- depleted embryos did not display any gross morphologic abnormalities of the nuclear envelope or nuclear

pore complex (NPC). The results suggested to the authors that Can is critical to cell cycle progression and required for both nuclear protein import and mRNA export.

[17881] It is appreciated that the abovementioned animal model for NUP214 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17882] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17883] van Deursen, J.; Boer, J.; Kasper, L.; Grosveld, G. : G(2) arrest and impaired nucleocytoplasmic transport in mouse embryos lacking the proto- oncogene CAN/Nup214. EMBO J. 15: 5574- 5583, 1996. ; and

[17884] von Lindern, M.; Poustka, A.; Lehrach, H.; Grosveld, G. : The (6;9) chromosome translocation, associated with a specific subtype of acute nonlymphocytic leukemia, leads to aberrant tra.

[17885] Further studies establishing the function and utilities of NUP214 are found in John Hopkins OMIM database record ID 114350, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nucleoporin 214kda (NUP214, Accession NP_705906.1) is another

GAM100 target gene, herein designated TARGET GENE. NUP214 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NUP214, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUP214 BINDING SITE, designated SEQ ID:18578, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17886] Another function of GAM100 is therefore inhibition of Nucleoporin 214kda (NUP214, Accession NP_705906.1), a gene which mediates nucleocytoplasmic transport. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP214.

[17887] The function of NUP214 has been established by previous studies. The CAN gene on human 9q34 forms a fusion gene with the DEK (OMIM Ref. No. 125264) gene at 6p23 in a subset of acute myeloid leukemia (acute nonlymphocytic leukemia) carrying a t(6;9)(p23;q34) translocation. Von Lindern et al. (1990) estimated that the CAN gene lies 360 kb distal to ABL (OMIM Ref. No. 189980). The break-

points in the translocations were clustered in an 8- kb intron of a gene encoding a 7.5- kb transcript. The gene was called Cain (symbol, CAN), presumably for 'cancer intron on nine.' The gene measured more than 65 kb and was transcribed 5- prime centromeric- to- 3- prime telomeric on the chromosome . It is the 3- prime portion of the CAN gene that participates in the fusion gene in the leukemogenic translocation t(6;9).

[17888] Animal model experiments lend further support to the function of NUP214. Van Deursen et al. (1996) created Can- /- knockout mice by targeted disruption and embryonic stem (ES) cell technology. No Can- /- knockout mice were identified in heterozygous crosses, demonstrating that Can is essential for embryonic development. Lethality occurs between 4.0- 4.5 days postcoitum, after the depletion of maternal Can sources. Homozygous Can- /- ES cells are not viable. In 3.5- day- old mutant embryos, cultured in vitro, progressive depletion of Can leads to cell cycle arrest in G2 phase, and eventually to blastocele collapse, impaired NLS- mediated protein uptake, and nuclear accumulation of polyadenylated RNA. The defective Can- depleted embryos did not display any gross morphologic abnormalities of the nuclear envelope or nuclear

pore complex (NPC). The results suggested to the authors that Can is critical to cell cycle progression and required for both nuclear protein import and mRNA export.

[17889] It is appreciated that the abovementioned animal model for NUP214 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17890] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17891] van Deursen, J.; Boer, J.; Kasper, L.; Grosveld, G. : G(2) arrest and impaired nucleocytoplasmic transport in mouse embryos lacking the proto- oncogene CAN/Nup214. EMBO J. 15: 5574- 5583, 1996. ; and

[17892] von Lindern, M.; Poustka, A.; Lehrach, H.; Grosveld, G. : The (6;9) chromosome translocation, associated with a specific subtype of acute nonlymphocytic leukemia, leads to aberrant tra.

[17893] Further studies establishing the function and utilities of NUP214 are found in John Hopkins OMIM database record ID 114350, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nuclear transport factor 2-like export factor 2 (NXT2, Accession

NP_061168.2) is another GAM100 target gene, herein designated TARGET GENE. NXT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NXT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NXT2 BINDING SITE, designated SEQ ID:14988, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17894] Another function of GAM100 is therefore inhibition of Nuclear transport factor 2-like export factor 2 (NXT2, Accession NP_061168.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXT2.

[17895] O-linked n-acetylglucosamine (glcnac) transferase (udp-n-acetylglucosamine:polypeptide-n-acetylglucosaminyl transferase) (OGT, Accession NP_003596.1) is another GAM100 target gene, herein designated TARGET GENE. OGT BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by OGT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of OGT BINDING SITE, designated SEQ ID:19937, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17896] Another function of GAM100 is therefore inhibition of O-linked n-acetylglucosamine (glcnac) transferase (udp-n-acetylglucosamine:polypeptide-n-acetylglucosaminyl transferase) (OGT, Accession NP_003596.1), a gene which has a role in the glycosylation of nuclear and cytoplasmic proteins. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGT.

[17897] The function of OGT has been established by previous studies. O- linked N- acetylglucosamine (O- GlcNAc) transferase (OGT) catalyzes the addition of a single N-acetylglucosamine in O- glycosidic linkage to serine or threonine residues. Since both phosphorylation and glycosylation compete for similar serine or threonine residues, the 2 processes may compete for sites, or they may alter the substrate specificity of nearby sites by steric or electrostatic effects (Lubas et al., 1997). Haltiwanger et al. (1992) purified rat liver OGT and determined that it has a molecular mass of 340 kD. They proposed that OGT ex-

ists as a heterotrimeric complex with 2 subunits of 110 kD and 1 of 78 kD. However, using rabbit OGT, Lubas et al. (1997) analyzed the proteolytic fingerprint of both polypeptides and found that the 2 are related. They suggested that the 78 kD band is a proteolytic product of the 110 kD polypeptide or the product of an alternative translation start site. Kreppel et al. (1997) cloned rat cDNAs encoding the 110- kD subunit. Immunofluorescence of human cells expressing rat OGT indicated that OGT is present in both the nucleus and cytosol.

[17898]

[17899] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17900] Kreppel, L. K.; Blomberg, M. A.; Hart, G. W. : Dynamic glycosylation of nuclear and cytosolic proteins: cloning and characterization of a unique O- GlcNAc transferase with multiple tetratricopeptide repeats. J. Biol. Chem. 272: 9308- 9315, 1997. ; and

[17901] Lubas, W. A.; Frank, D. W.; Krause, M.; Hanover, J. A. : O-linked GlcNAc transferase is a conserved nucleocytoplasmic protein containing tetratricopeptide repeats. J. Biol. Chem. 272: 9.

[17902] Further studies establishing the function and utilities of OGT are found in John Hopkins OMIM database record ID 300255, and in cited publications listed in Table 5, which are hereby incorporated by reference.P2RY12 (Accession NP_073625.1) is another GAM100 target gene, herein designated TARGET GENE. P2RY12 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by P2RY12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P2RY12 BINDING SITE, designated SEQ ID:11851, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17903] Another function of GAM100 is therefore inhibition of P2RY12 (Accession NP_073625.1), a gene which couples to udp- glucose and other udp- sugar and therefore is associated with Platelet adp receptor defect. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of Platelet adp receptor defect, and of other diseases and clinical conditions associated with P2RY12.

[17904] The function of P2RY12 has been established by previous studies. Nurden et al. (1995) studied a family with what

may be a similar abnormality in that ADP induced a small and rapidly reversible platelet aggregation even at high doses. This was associated with a markedly reduced binding of ADP to platelets and a failure of ADP to lower the content of cAMP of platelets preincubated with prostaglandin E1. Electron microscopy showed that the ADP- induced aggregates of platelets in the proband were composed of loosely bound shape- changed platelets with few contact points. Thus, this receptor defect has had a direct influence on the capacity of platelets to bind to each other in response to ADP. The proband was a 61-year- old Caucasian man with a history of episodes of excessive bleeding. The first severe episode occurred at the age of 17 when, after a minor accident, he developed a subretinal hemorrhage that led to the loss of an eye. A second major episode occurred during surgery performed when he was 28 years old. The third episode occurred during middle age when pulmonary bleeding led to hemoptysis. Other affected members of the family included a sister, an uncle who died as a result of severe epistaxis, and his father, who died from bleeding after a motor accident. The parents were cousins. There was no information on the mother, who died during the proband's

early childhood. Studies in the sister appeared to indicate that she was similarly involved, whereas the only offspring of the proband appeared normal. Despite the consanguinity, the inheritance of the defect may be autosomal dominant. ADP mediates platelet aggregation through its action on 2 G protein- coupled receptor subtypes. The P2Y1 receptor (P2RY1; 601167) couples to Gq and mobilizes intracellular calcium ions to mediate platelet shape change and aggregation. The second ADP receptor required for aggregation, variously called P2YADP, P2YAC, P2YCYC, or P2TAC, is coupled to the inhibition of adenylyl cyclase through Gi. This receptor is the target of efficacious antithrombotic agents, such as ticlopidine and clopidogrel. To identify this Gi- linked platelet ADP receptor, Hollopeter et al. (2001) engineered Xenopus oocytes to allow the detection of Gi- linked responses through a sensitive electrophysiologic assay. The human gene cloned, which the authors termed P2Y12, encodes a protein of 342 amino acids that contains 4 extracellular cysteine residues. Northern blot analysis detected abundant P2Y12 expression in human platelets, with lower expression in brain. The predominant transcript of 2.4 kb was absent from all other tissues examined, including peripheral

blood leukocytes. A fainter species of approximately 4.5 kb was also detected in platelet and brain, whereas a prominent band of approximately 1.0 kb was observed only in platelet RNA. Within the brain, the 2.4- kb species was observed in numerous subregions, including the amygdala, caudate nucleus, corpus callosum, hippocampus, substantia nigra, and thalamus. In situ hybridization suggested a glial expression pattern.

[17905]

[17906] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17916] Further studies establishing the function and utilities of P2RY12 are found in John Hopkins OMIM database record

ID 600515, and in cited publications listed in Table 5, which are hereby incorporated by reference.Paired basic amino acid cleaving system 4 (PACE4, Accession NP_612192.1) is another GAM100 target gene, herein designated TARGET GENE. PACE4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PACE4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PACE4 BINDING SITE, designated SEQ ID:6407, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17917] Another function of GAM100 is therefore inhibition of Paired basic amino acid cleaving system 4 (PACE4, Accession NP_612192.1), a gene which processes hormone precursors by cleaving paired basic amino acids. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE4.

[17918] The function of PACE4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM31.1.Paired basic amino acid cleaving system 4 (PACE4, Accession NP_002561.1) is another GAM100 target gene, herein designated TARGET GENE. PACE4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PACE4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PACE4 BINDING SITE, designated SEQ ID:6407, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17919] Another function of GAM100 is therefore inhibition of Paired basic amino acid cleaving system 4 (PACE4, Accession NP_002561.1), a gene which processes hormone precursors by cleaving paired basic amino acids. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE4.

[17920] The function of PACE4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.1.Poly(a)-specific ribonuclease (deadenylation nuclease) (PARN, Accession NP_002573.1) is another

GAM100 target gene, herein designated TARGET GENE. PARN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PARN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PARN BINDING SITE, designated SEQ ID:12302, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17921] Another function of GAM100 is therefore inhibition of Poly(a)-specific ribonuclease (deadenylation nuclease) (PARN, Accession NP_002573.1), a gene which degrades mRNA poly(A) tails during oocyte maturation. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARN.

[17922] The function of PARN has been established by previous studies. Exonucleolytic degradation of the poly(A) tail is often the first step in the decay of eukaryotic mRNAs. Korner and Wahle (1997) purified the enzyme for deadenylation, PARN, which they named DAN, from calf thymus. Korner et al. (1998) partially sequenced the bovine PARN protein. By searching an EST database with the bovine

PARN peptide sequences, they identified a human PARN EST encoding a deduced 639- amino acid protein. The calculated molecular mass of human PARN is 73.5 kD, which was the mass of recombinant PARN expressed in E. coli. The human PARN protein shows sequence similarity to the RNase D family of 3- prime exonucleases, which includes E. coli polymerase I. PARN is a 3- prime exonuclease that prefers poly(A) as the substrate. In an in vitro assay, PARN activity was partially inhibited by PAB1 (OMIM Ref. No. 604679), resulting in phased shortening of the poly(A) tail of the polyadenylated RNA substrate. The PARN protein is located in both the nucleus and the cytoplasm. It is not stably associated with polysomes or ribosomal subunits. Northern blot analysis detected a 3.1- kb PARN transcript in HeLa cell extracts. The authors noted that the PARN gene is widely expressed. Korner et al. (1998) noted that the PARN gene maps to chromosome 16.

[17923]

[17924] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17925] Korner, C. G.; Wahle, E. : Poly(A) tail shortening by a

mammalian poly(A)- specific 3- prime- exoribonuclease. J. Biol. Chem. 272: 10448- 10456, 1997. ; and

[17926] Korner, C. G.; Wormington, M.; Muckenthaler, M.; Schneider, S.; Dehlin, E.; Wahle, E. : The deadenylating nuclease (DAN) is involved in poly(A) tail removal during the meiotic maturation.

[17927] Further studies establishing the function and utilities of PARN are found in John Hopkins OMIM database record ID 604212, and in cited publications listed in Table 5, which are hereby incorporated by reference.PHF11 (Accession NP_057203.1) is another GAM100 target gene, herein designated TARGET GENE. PHF11 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PHF11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PHF11 BINDING SITE, designated SEQ ID:608, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17928] Another function of GAM100 is therefore inhibition of PHF11 (Accession NP_057203.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHF11.

[17929] Protein kinase, dna-activated, catalytic polypeptide (PRKDC, Accession NP_008835.5) is another GAM100 target gene, herein designated TARGET GENE. PRKDC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKDC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKDC BINDING SITE, designated SEQ ID:9408, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17930] Another function of GAM100 is therefore inhibition of Protein kinase, dna-activated, catalytic polypeptide (PRKDC, Accession NP_008835.5), a gene which is a novel member of the protein (PKC) gene family. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKDC.

[17931] The function of PRKDC has been established by previous studies. DNA- dependent protein kinase is a nuclear protein serine/threonine kinase present in a wide variety of eukaryotic species. One of its conspicuous features is that it must be bound to DNA to express its catalytic proper-

ties. It can be fractionated into 2 components: one is a large polypeptide corresponding to the catalytic subunit. On its own, the catalytic subunit of DNA- PK is inactive and relies on the other DNA- PK component to direct it to the DNA and trigger its kinase activity. The second component is the autoimmune antigen Ku (OMIM Ref. No. 152690), which is encoded by a gene, G22P1, located on chromosome 22q. One physiologic function for DNA- PK may be to modulate transcription, since it has been shown to phosphorylate several transcription factors in vitro (Anderson and Lees- Miller, 1992). Also, purified human DNA- PK has been reported to inhibit RNA polymerase I transcription in a purified mouse in vitro system (Kuhn et al., 1995) and in a partially purified Xenopus laevis cell extract (Labhart, 1995), although DNA- PK did not similarly inhibit transcription by RNA polymerases II or III (Labhart, 1995). Hartley et al. (1995) noted that DNA- PK activation requires DNA double- stranded breaks for other discontinuities in the DNA double helix, owing to the fact that Ku binds specifically to these structures. This suggests that DNA- PK may function in vivo by recognizing DNA ends at sites of DNA damage or that occur as recombination intermediates. Indeed, cells defective in DNA- PK

components are hypersensitive to killing by ionizing radiation owing to an inability to repair double- stranded breaks effectively. Cells defective in either Ku or DNA- PK catalytic subunit are also unable to perform V(D)J recombination, the site- specific recombination process that takes place in developing B and T lymphocytes to generate the variable regions of immunoglobulin and T cell receptor genes. In the absence of DNA- PK function, V(D)J recombination intermediates are unable to be processed and ligated. In mammalian cells, abrogation of telomeric repeat- binding factor TRF2 (OMIM Ref. No. 602027) or DNA- PK activity causes end- to- end chromosomal fusion, thus establishing a central role for these proteins in telomere function. Bailey et al. (2001) demonstrated that TRF2- mediated end- capping occurs after telomere replication. The postreplicative requirement for TRF2 and DNA- PK catalytic subunit is confined to only half of the telomeres, namely, those that were produced by leading-strand DNA synthesis. Bailey et al. (2001) concluded that their results demonstrate a crucial difference in postreplicative processing of telomeres that is linked to their mode of replication. Ma et al. (2002) reported that the Artemis protein (OMIM Ref. No. 605988) forms a com-

plex with PRKDS in the absence of DNA. The purified Artemis protein alone possesses single- strand- specific 5- prime- to- 3- prime exonuclease activity. Upon complex formation, PRKDS phosphorylates Artemis, and Artemis acquires endonucleolytic activity on 5- prime and 3- prime overhangs, as well as hairpins. The Artemis-PRKDS complex can open hairpins generated by the RAG (see OMIM Ref. No. 179615) complex. Thus, PRKDC regulates Artemis by both phosphorylation and complex formation to permit enzymatic activities that are critical for the hairpin- opening step of V(D)J recombination and for the 5- prime and 3- prime overhang processing in non-homologous DNA end joining.

[17932]

[17933] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17934] Bailey, S. M.; Cornforth, M. N.; Kurimasa, A.; Chen, D. J.; Goodwin, E. H. : Strand- specific postreplicative processing of mammalian telomeres. Science 293: 2462- 2465, 2001. ; and

[17935] Ma, Y.; Pannicke, U.; Schwarz, K.; Lieber, M. R. : Hairpin opening and overhang processing by an Artemis/DNA-

dependent protein kinase complex in nonhomologous end joining and V(D)J rec.

[17936] Further studies establishing the function and utilities of PRKDC are found in John Hopkins OMIM database record ID 600899, and in cited publications listed in Table 5, which are hereby incorporated by reference.Prostaglandin-endoperoxide synthase 2 (prostaglandin g/h synthase and cyclooxygenase) (PTGS2, Accession NP_000954.1) is another GAM100 target gene, herein designated TARGET GENE. PTGS2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTGS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTGS2 BINDING SITE, designated SEQ ID:10794, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17937] Another function of GAM100 is therefore inhibition of Prostaglandin-endoperoxide synthase 2 (prostaglandin g/h synthase and cyclooxygenase) (PTGS2, Accession NP_000954.1), a gene which may have a role as a major mediator of inflammation and/or a role for prostanoid

signaling in activity- dependent plasticity. and therefore may be associated with Inflammatory diseases such as rheumatoid arthritis. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of Inflammatory diseases such as rheumatoid arthritis., and of other diseases and clinical conditions associated with PTGS2.

[17938] The function of PTGS2 has been established by previous studies. Inflammation causes the induction of COX2, leading to the release of prostanoids, which sensitize peripheral nociceptor terminals and produce localized pain hypersensitivity. Peripheral inflammation also generates pain hypersensitivity in neighboring uninjured tissue, because of the increased neuronal excitability in the spinal cord, and a syndrome comprising diffuse muscle and joint pain, fever, lethargy, and anorexia. Samad et al. (2001) showed that COX2 may be involved in central nervous system (CNS) responses, by finding a widespread induction of COX2 expression in spinal cord neurons and in other regions of the CNS, elevating prostaglandin E2 (PGE2) levels in the cerebrospinal fluid. The major inducer of central COX2 upregulation is IL1- beta in the CNS, and as basal phospholipase A2 (see OMIM Ref. No. 600522) activity in the CNS does not change with peripheral inflammation,

COX2 levels must regulate central prostanoid production. In the rat, intraspinal administration of an interleukin-converting enzyme or COX2 inhibitor decreased inflammation- induced central PGE2 levels and mechanical hyperalgesia. Thus, Samad et al. (2001) concluded that preventing central prostanoid production by inhibiting the IL1- beta- mediated induction of COX2 in neurons or by inhibiting central COX2 activity reduces centrally generated inflammatory pain hypersensitivity.

[17939] Animal model experiments lend further support to the function of PTGS2. Morham et al. (1995) noted that cyclooxygenase- 2 (COX2) is induced at high levels in migratory and other responding cells by proinflammatory stimuli. COX2 is generally considered to be a mediator of inflammation. Its isoform, COX1, is constitutively expressed in most tissues and is thought to mediate 'housekeeping' functions. These 2 enzymes are therapeutic targets of the widely used nonsteroidal antiinflammatory drugs (OMIM Ref. No. NSAIDs). To investigate further the different physiologic roles of these isoforms, Morham et al. (1995) used homologous recombination to disrupt the mouse gene encoding COX2 (Ptgs2). Mice lacking COX2 were found to have normal inflammatory responses to

treatments with tetradecanoyl phorbol acetate or arachidonic acid. However, they developed severe nephropathy and were susceptible to peritonitis.

[17940] It is appreciated that the abovementioned animal model for PTGS2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17941] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17942] Morham, S. G.; Langenbach, R.; Loftin, C. D.; Tiano, H. F.; Vouloumanos, N.; Jennette, J. C.; Mahler, J. F.; Kluckman, K. D.; Ledford, A.; Lee, C. A.; Smithies, O. : Prostaglandin synthase 2 gene disruption causes severe renal pathology in the mouse. Cell 83: 473- 482, 1995. ; and

[17943] Samad, T. A.; Moore, K. A.; Sapirstein, A.; Billet, S.; Allchorne, A.; Poole, S.; Bonventre, J. V.; Woolf, C. J. : Interleukin- 1- beta- mediated induction of Cox- 2 in the CNS contributes.

[17944] Further studies establishing the function and utilities of PTGS2 are found in John Hopkins OMIM database record ID 600262, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rab27a,

member ras oncogene family (RAB27A, Accession NP_004571.2) is another GAM100 target gene, herein designated TARGET GENE. RAB27A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB27A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB27A BINDING SITE, designated SEQ ID:10792, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17945] Another function of GAM100 is therefore inhibition of Rab27a, member ras oncogene family (RAB27A, Accession NP_004571.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB27A.

[17946] Ran binding protein 2-like 1 (RANBP2L1, Accession NP_005045.1) is another GAM100 target gene, herein designated TARGET GENE. RANBP2L1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RANBP2L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of RANBP2L1 BINDING SITE, designated SEQ ID:3869, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17947] Another function of GAM100 is therefore inhibition of Ran binding protein 2-like 1 (RANBP2L1, Accession NP_005045.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP2L1.

[17948] Retinoblastoma binding protein 1 (RBBP1, Accession NP_075377.1) is another GAM100 target gene, herein designated TARGET GENE. RBBP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RBBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBBP1 BINDING SITE, designated SEQ ID:15909, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17949] Another function of GAM100 is therefore inhibition of Retinoblastoma binding protein 1 (RBBP1, Accession NP_075377.1) . Accordingly, utilities of GAM100 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP1.

[17950] Retinoblastoma binding protein 1 (RBBP1, Accession NP_075376.1) is another GAM100 target gene, herein designated TARGET GENE. RBBP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RBBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBBP1 BINDING SITE, designated SEQ ID:15909, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17951] Another function of GAM100 is therefore inhibition of Retinoblastoma binding protein 1 (RBBP1, Accession NP_075376.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP1.

[17952] Retinoblastoma binding protein 1 (RBBP1, Accession NP_002883.2) is another GAM100 target gene, herein designated TARGET GENE. RBBP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RBBP1, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBBP1 BINDING SITE, designated SEQ ID:15909, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17953] Another function of GAM100 is therefore inhibition of Retinoblastoma binding protein 1 (RBBP1, Accession NP_002883.2) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP1.

[17954] Selectin e (endothelial adhesion molecule 1) (SELE, Accession NP_000441.1) is another GAM100 target gene, herein designated TARGET GENE. SELE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SELE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:5666, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17955] Another function of GAM100 is therefore inhibition of Selectin e (endothelial adhesion molecule 1) (SELE, Accession

NP_000441.1), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE.

[17956] The function of SELE has been established by previous studies. Zheng et al. (2001) examined whether a polymorphism in the SELE gene, due to a G- to- T mutation (98G-T) in the untranslated region of exon 2, was related to premature coronary artery disease (CAD). Both lipid and nonlipid risk factors, including the ser128- to- arg substitution studied by Wenzel et al. (1994), were also assessed. The frequency of the 98G- T mutation was found to be significantly increased among male patients under 45 years of age and female patients under 55 years of age. After controlling for other CAD risk factors by multiple logistic analysis, the 98G- T mutation was still a significant predictor of premature CAD. The glaucomas are a group of optic neuropathies comprising the leading cause of irreversible blindness worldwide. Elevated intraocular pressure due to a reduction in normal aqueous outflow is a major causal risk factor. Wang et al. (2001) found that ELAM1, the earliest marker for the atherosclerotic plaque

in the vasculature, was consistently present on trabecular meshwork cells in the outflow pathways of eyes with glaucomas of diverse etiology. They determined expression of ELAM1 to be controlled by activation of an interleukin- 1 (see OMIM Ref. No. 147760) autocrine feedback loop through transcription factor NK- kappa- B (see OMIM Ref. No. 164011), and activity of this signaling pathway was shown to protect trabecular meshwork cells against oxidative stress. Wang et al. (2001) concluded that their findings characterized a protective stress response specific to the eye's aqueous outflow pathways and provided the first known diagnostic indicator of glaucomatous trabecular meshwork cells. They further indicated that common mechanisms contribute to the pathophysiology of the glaucomas and vascular diseases.

[17957]

[17958] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17959] Wang, N.; Chintala, S. K.; Fini, M. E.; Schuman, J. S. : Activation of a tissue- specific stress response in the aqueous outflow pathway of the eye defines the glaucoma disease phenotype. Nature Med. 7: 304- 309, 2001. ; and

[17960] Zheng, F.; Chevalier, J. A.; Zhang, L. Q.; Virgil, D.; Ye, S. Q.; Kwiterovich, P. O. : An HphI polymorphism in the E-selectin gene is associated with premature coronary artery diseas.

[17961] Further studies establishing the function and utilities of SELE are found in John Hopkins OMIM database record ID 131210, and in cited publications listed in Table 5, which are hereby incorporated by reference.SERPINA11 (Accession NP_783866.1) is another GAM100 target gene, herein designated TARGET GENE. SERPINA11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SERPINA11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SERPINA11 BINDING SITE, designated SEQ ID:8073, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17962] Another function of GAM100 is therefore inhibition of SERPINA11 (Accession NP_783866.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINA11.

[17963] Serine (or cysteine) proteinase inhibitor, clade b (ovalbumin), member 7 (SERPINB7, Accession NP_003775.1) is another GAM100 target gene, herein designated TARGET GENE. SERPINB7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SERPINB7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SERPINB7 BINDING SITE, designated SEQ ID:18333, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17964] Another function of GAM100 is therefore inhibition of Serine (or cysteine) proteinase inhibitor, clade b (ovalbumin), member 7 (SERPINB7, Accession NP_003775.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB7.

[17965] Sh3-domain grb2-like endophilin b1 (SH3GLB1, Accession NP_057093.1) is another GAM100 target gene, herein designated TARGET GENE. SH3GLB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SH3GLB1, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SH3GLB1 BINDING SITE, designated SEQ ID:19111, to the nucleotide sequence of GAM100 RNA, herein designated GAM RNA, also designated SEQ ID:243.

[17966] Another function of GAM100 is therefore inhibition of Sh3-domain grb2-like endophilin b1 (SH3GLB1, Accession NP_057093.1) . Accordingly, utilities of GAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3GLB1.
